

Keysight Technologies

Simplify Complex High-Speed
Multichannel Acquisition Systems
in Big Physics Experiments

Application Brief

Abstract

Your job is to expand knowledge at the galactic or nanometer scale. You need to be confident that the results of your big physics experiments – whether plasma and inertial confinement fusion, particle acceleration, microwave and RF astrophysics, or x-ray imaging in hydrodynamics – are accurately captured by dependable measurement solutions that provide exceptional speed and measurement fidelity.

Simplifying the data acquisition system within these experiments can be a non-negligible task. Achieve successful complex multichannel big physics experiments with the Keysight Technologies multichannel digitizers which contain all the timing and synchronization technologies needed to create synchronous sampling across 10s or 100s of channels at a time.

Introduction

Big physics experiments form the backbone for some of the world's most crucial projects such as fusion research for the development of clean sustainable energy, the research into the origins of the universe and the investigation and discovery of sub-atomic particles.

The instrumentation of these experiments often relies upon the use of multiple transducers and arrays of devices that must be integrated into the lab environment.

High-speed digitizers provide the crucial data capture component in these systems and the quality of the measurement often relies on the performance of these devices.

Application Overview

As a scientist, you must define cost effective solutions for complex measurement tasks.

Typically you want to model an event or a process obtaining as much information as possible. This often includes an array of fast detectors of differing characteristics whether photomultiplier tubes (PMT), beam current transformers, spectrometers, fast diodes, or other detectors.

To correctly recreate the event or process from captured data, you need confidence in the triggering and synchronization of 10s or 100s of channels used in the experimental setup.

Often, the challenge for the scientist is the integration of the various transducer and digitizer components into the complex environment of the experiment. Triggering and timing data of multichannel systems must be known across all of the channels to allow faithful data reconstruction. The data acquisition system must be integrated not only into the hardware environment of the experimental machine, but also into the software environment.

Traditional solutions can be power hungry and bulky, leading to further requirements in laboratory space and even additional power and climate control to house the instrumentation system.

Solution

In laboratories around the world, Keysight instrumentation has become an integral part of advanced experimental systems. Our instruments are used in two major areas that require high-speed measurements: real-time applications, and single-shot or event-based applications. We provide the extreme speed and precision needed for system monitoring and control, and for capturing data from the interactions and events in the experiments themselves.

The Keysight M9703A multichannel AXIe digitizer module is an 8 channel, DC coupled, 12-bit digitizer for the capture of fast signals. The hardware is supported with a range of API's in Windows and LINUX environments. It integrates state of the art ADC technology in a standard modular form factor (AXIe), to simplify system development.

Ordering Information

Model	Description
M9703A	AXIe 12-bit digitizer
M9703A-SR1	1 GS/s sampling rate
M9703A-SR2	1.6 GS/s sampling rate
M9703A-INT	Interleaved channel sampling functionality
M9703A-F05	650 MHz maximum analog bandwidth
M9703A-F10	1 GHz bandwidth additional path
M9703A-M10	1 GB (64 MS/ch) acquisition memory
M9703A-M20	2 GB (128 MS/ch) acquisition memory
M9703A-M40	4 GB (256 MS/ch) acquisition memory
