Errata

Title & Document Type: 8590A RF Spectrum Analyzer Installation and Verification Manual

Manual Part Number: 08590-90131

Revision Date: March 1990

HP References in this Manual

This manual may contain references to HP or Hewlett-Packard. Please note that Hewlett-Packard's former test and measurement, semiconductor products and chemical analysis businesses are now part of Agilent Technologies. We have made no changes to this manual copy. The HP XXXX referred to in this document is now the Agilent XXXX. For example, model number HP8648A is now model number Agilent 8648A.

About this Manual

We’ve added this manual to the Agilent website in an effort to help you support your product. This manual provides the best information we could find. It may be incomplete or contain dated information, and the scan quality may not be ideal. If we find a better copy in the future, we will add it to the Agilent website.

Support for Your Product

Agilent no longer sells or supports this product. You will find any other available product information on the Agilent Test & Measurement website:

www.tm.agilent.com

Search for the model number of this product, and the resulting product page will guide you to any available information. Our service centers may be able to perform calibration if no repair parts are needed, but no other support from Agilent is available.
Installation and Verification Manual

HP 8590A Portable RF Spectrum Analyzer
Includes Options 001 and H18
Assistance

Product maintenance agreements and other customer assistance agreements are available for Hewlett-Packard products.

For any assistance, contact your nearest Hewlett-Packard Sales and Service Office.

Safety Symbols

The following safety symbols are used throughout this manual. Familiarize yourself with each of the symbols and its meaning before operating this instrument.

Caution

The caution sign denotes a hazard. It calls attention to a procedure which, if not correctly performed or adhered to, could result in damage to or destruction of the instrument. Do not proceed beyond a caution sign until the indicated conditions are fully understood and met.

Warning

The warning sign denotes a hazard. It calls attention to a procedure which, if not correctly performed or adhered to, could result in injury or loss of life. Do not proceed beyond a warning sign until the indicated conditions are fully understood and met.

General Safety Considerations

Warning

Before this instrument is switched on, make sure it has been properly grounded through the protective conductor of the ac power cable to a socket outlet provided with protective earth contact.

Any interruption of the protective (grounding) conductor, inside or outside the instrument, or disconnection of the protective earth terminal can result in personal injury.

Warning

There are many points in the instrument which can, if contacted, cause personal injury. Be extremely careful.

Any adjustments or service procedures that require operation of the instrument with protective covers removed should be performed only by trained service personnel.

Caution

Before this instrument is switched on, make sure its primary power circuitry has been adapted to the voltage of the ac power source.

Failure to set the ac power input to the correct voltage could cause damage to the instrument when the ac power cable is plugged in.
HP 8590A Spectrum Analyzer Documentation Description

Manuals Shipped with Your HP 8590A

- The Installation and Verification Manual (HP part number 08590-90130) and the Operating Manual (HP part number 08590-90005) are packaged in the Documentation Package (HP part number 08590-90001).

HP 8590A Installation and Verification Manual (HP part number 08590-90130)
- Describes how to install the HP 8590A Spectrum Analyzer.
- Tells how to make measurements with your HP 8590A Spectrum Analyzer.
- Describes analyzer features.
- Details what to do in case of a failure.

HP 8590A Operating Manual (HP part number 08590-90005)
- Describes how to make a simple measurement with the HP 8590A.
- Briefly describes the analyzer functions.
- Lists all programming commands.

Options

- Provides an additional copy of the Installation and Verification Manual.
- Provides an additional copy of the Operating Manual.
- The Option 910 is also available by ordering HP part number 08590-90001.

- Describes troubleshooting and repair of the analyzer.
- Provides an additional copy of the Documentation Package.
- The Documentation Package is also available by ordering HP part number 08590-90001.
- The Support Manual is also available by ordering HP part number 08590-90096.

Programming Manuals
- Describes analyzer operation via remote controller (computer).
- HP part number 08590-90011 (Option 021, HP-IB)
- HP part number 08590-90013 (Option 022, HP-IL)
- HP part number 08590-90015 (Option 023, RS-232)

How to Order Manuals

Each of the manuals listed above can be ordered individually. To order, contact your local Hewlett-Packard Sales and Service Office.
How to Use This Manual

Where to Start

If you have just received the HP 8590A and want to get it ready to use for the first time:

- Skim Chapter 1, “Introducing the HP 8590A,” for a brief introduction to the unit and its capabilities.
- Thoroughly read Chapter 2, “Preparation for Use,” and follow its instructions for:
  - Unpacking the unit.
  - Preparing it for use.
  - Performing initial self-calibration routines (these are automatic self-checks and require no test equipment).
- If you need to verify the unit is operating within its specifications, perform the performance tests in Chapter 3, “Performance Tests.”
- Chapter 4, “If Something Goes Wrong . . . ,” details additional information for dealing with problems or questions pertaining to your analyzer.

If the Analyzer Has Been in Use

To verify that it is operating correctly or to solve an apparent problem:

- Perform the calibration routines at the end of Chapter 2, “Preparation for Use,” for a quick indication of proper operation.
- If you have the necessary test equipment, perform the performance tests in Chapter 3, “Performance Tests,” to verify that the unit is operating within its specifications.
- If there is an apparent problem, read Chapter 4, “If Something Goes Wrong . . . ,” for hints on what may be wrong and how to solve the problem, and instructions for calling Hewlett-Packard for additional help.

Manual Terms and Conventions

Front-panel keys appear within a box, for example [FRONT-PANEL KEY]. Softkeys appear within a shaded box, for example [SOFTKEY].
Electrostatic Discharge

Electrostatic discharge (ESD) can damage or destroy electronic components. All work on electronic assemblies should be performed at a static-safe workstation. Figure 1 shows an example of a static-safe workstation using two types of ESD protection:

- Conductive table-mat and wrist-strap combination.
- Conductive floor-mat and heel-strap combination.

Both types, when used together, provide a significant level of ESD protection. Of the two, only the table-mat and wrist-strap combination provides adequate ESD protection when used alone.

To ensure user safety, the static-safe accessories must provide at least 1 MΩ of isolation from ground. Refer to Figure 1 for information on ordering static-safe accessories.

---

**Warning**

These techniques for a static-safe workstation should not be used when working on circuitry with a voltage potential greater than 500 volts.

---

![Figure 1. Example of a Static-Safe Workstation](image-url)
Reducing Damage Caused by ESD

The following suggestions may help reduce ESD damage that occurs during testing and servicing operations.

- Before connecting any coaxial cable to an analyzer connector for the first time each day, momentarily ground the center and outer conductors of the cable.

- Personnel should be grounded with a resistor-isolated wrist strap before touching the center pin of any connector and before removing any assembly from the unit.

- Be sure that all instruments are properly earth-grounded to prevent a buildup of static charge.

Table 1 lists static-safe accessories that can be obtained from Hewlett-Packard by using the HP part numbers shown.

Introducing the HP 8590A

What You’ll Find in This Chapter

This chapter introduces you to the HP 8590A Spectrum Analyzer and its options and accessories that tailor the unit to your specific needs. To acquaint you with the analyzer’s full capabilities, the HP 8590A specifications and characteristics are also provided.

Introducing the HP 8590A Spectrum Analyzer

![Image of HP 8590A Spectrum Analyzer]

Figure 1-1. The HP 8590A Spectrum Analyzer

The HP 8590A Spectrum Analyzer is a small, lightweight test instrument that combines a wide frequency range (10 kHz to 1.5 GHz) and amplitude range (−115 dBm to +30 dBm) with over 100 easy-to-use functions to handle just about any RF signal measurement. Its portability and ease, highly automatic operation make it ideal for service and troubleshooting use in R&D labs and in manufacturing and service environments in the CATV, mobile radio, and related communications businesses.

The HP 8590A is a complete, self-contained instrument that needs only an external ac power source for operation. An ac power cable, suitable for use in the country to which the analyzer is originally shipped, is included with the unit.
Options and Accessories Available

Options

Many options are available to tailor the HP 8590A to your needs. Options can be ordered by option number when you order the analyzer. Some of the options are also available as kits that can be ordered and installed after you have received your HP 8590A.

75Ω Input Impedance (Option 001)

This option provides a 75Ω input impedance instead of the standard 50Ω impedance. Analyzers with this option use different IF and RF circuit boards and a different front panel from the standard units.

Warning

Do not connect 50Ω cables or adapters to the Option 001, 75Ω RF INPUT or CAL OUTPUT connectors. Damage to the 75Ω connectors will occur.

HP-IB (Option 021)

Option 021 enables you to control your HP 8590A from a computer that uses an HP-IB interface bus. Such computers include the HP 9000 series 200 and 300 and the HP Vectra. The option also enables the HP 8590A to control a printer or plotter. Option 021 includes an HP-IB connector on the rear panel and an HP-IB Programming Manual.

Option 021 is also available as a kit (HP part number 08590-60052). The kit includes a printed circuit board, connector, manual, and installation instructions.

HP-IL (Option 022)

Option 022 enables you to control your HP 8590A from a computer that uses an HP-IL interface bus. Such computers include the HP-71 and the HP-75. The option also enables the HP 8590A to control a printer or plotter. Option 022 includes an HP-IL connector on the rear panel and an HP-IL Programming Manual.

Option 022 is also available as a kit (HP part number 08590-60053). The kit includes a printed circuit board, connector, manual, and installation instructions.

RS-232 (Option 023)

Option 023 enables you to control your HP 8590A from a computer that uses an RS-232 interface bus. Such computers include the HP Vectra, the IBM PC, XT, and AT, and compatibles. The option also enables the HP 8590A to control a printer or plotter. Option 023 includes an RS-232 connector on the rear panel and an RS-232 Programming Manual.

Option 023 is also available as a kit (HP part number 08590-60054). The kit includes a printed circuit board, connector, manual, and installation instructions.
Front Panel Cover (Option 040)

The front-panel cover snaps onto the front of your HP 8590A to protect the front panel during travel and when the unit is not in use. The cover has a recessed area in which you can store the HP 8590A Operating Manual, a programming manual, or an HP-71 Handheld Computer.

Option 040 is also available as a kit (Impact Cover Assembly, Deep; HP part number 5062-4805).

Rack Mount Flange Kit (Option 908)

This option provides the parts necessary to mount the HP 8590A in an HP System II cabinet or in a standard 19 inch (482.6 mm) equipment rack.

Option 908 is also available as a kit (HP part number 5062-0800).

1.79 GHz Extended Frequency (Option H18)

Option H18 extends the upper limit of the frequency range over which the HP 8590A is specified from 1.5 GHz to 1.79 GHz.

Rack Mount Flange Kit with Handles (Option 909)

Option 909 is the same as Option 908 but includes front handles for added convenience.

Option 909 is also available as a kit (HP part number 5062-1900).

Operating and Installation Manuals (Option 910)

An additional copy of the HP 8590A Operating Manual and the Installation Verification Manual are available as a set under Option 910. This set is called the Documentation Package, and has HP part number 08590-90001.

Service Documentation (Option 915)

Option 915 includes one copy of the HP 8590A Operating Manual, the Installation Verification Manual, and the Support Manual. This set is called the Support Package and has HP part number 08590-90007.

The Support Manual is available separately as HP part number 08590-90096.

Accessories

A number of accessories are available from Hewlett-Packard to help you configure your HP 8590A for your specific needs.

AC Probe

The HP 8590A has a front-panel PROBE POWER connector for the use of high-impedance active probes such as the HP 85024A. High-impedance probes permit you to test high-frequency circuits without significant loading effects.

Caution

Do not use dc-coupled probes; they may cause damage to the spectrum analyzer input circuit.
Broadband Preamplifier

The HP 10855A Preamp provides a minimum of 22 dB gain from 2 MHz to 1300 MHz to enhance measurements of very low-level signals. It operates conveniently from the PROBE POWER output of the HP 8590A.

Close Field Probe

The HP 11940A Close Field Probe is a small, hand-held, electromagnetic-field sensor. The probe provides repeatable, absolute, magnetic-field measurements from 30 MHz to 1 GHz. When attached to a source, the probe generates a localized magnetic field for electromagnetic interference (EMI) susceptibility testing.

Computer

The HP-71 Handheld Computer is a powerful, readily portable computational tool well suited to test instrument control. It uses a powerful BASIC language that allows structured programming techniques. It can be used to control the HP 8590A through the HP-IL interface (Option 022 for the HP 8590A).

Monitor

The HP 82913A is a 12-inch monitor that provides a larger display for the HP 8590A in fixed installations.

Plotter

The HP ColorPro 7440A Graphics Plotter adds a color printout capability to the HP 8590A for permanent records of important measurements. The eight-pen HP ColorPro produces color plots with 0.025 mm (0.001 in) resolution either on 8.5 by 11 inch paper or transparency film. The plotter can be ordered with HP-IB or RS-232 interfaces to correspond to the interface option installed on the HP 8590A.

Printer

The HP 2225A ThinkJet Personal Printer provides fast, quiet, portable printing with graphics capability for another form of permanent records of your test results. The printer can be ordered with HP-IB, HP-IL, or RS-232 interfaces to correspond to the interface option installed on the HP 8590A.

Rack Slide Kit

This kit (HP part number 1494-0060) provides the hardware to adapt Rack Mount Kits (Options 908 and 909) for mounting the analyzer on slides in an HP System II cabinet.

RF Limiter

The HP 11867A Limiter protects the analyzer input circuits from damage due to high power levels. It operates over a frequency range of dc to 1800 MHz and begins reflecting signal levels over 1 mV up to 10 watts average power and 100 watts peak power.

1-4 Introducing the HP 8590A
Tracking Generator

The HP 8444A Option 59 Tracking Generator provides a leveled, calibrated signal output with a frequency equal to the tuned frequency of the HP 8590A. This lets you make swept frequency tests such as insertion loss and return loss at frequencies up to 1500 MHz.

Transit Case

The transit case (HP part number 9211-5604) provides extra protection for your HP 8590A for frequent travel situations. The HP transit case protects your instrument from hostile environments, shock, vibration, moisture, and impact while providing a secure enclosure for shipping.

50Ω/75Ω Minimum Loss Pad

The HP 11852A is a low VSWR minimum loss pad that is required for measurements on 75Ω devices. Use with a 75Ω Type N (f) to BNC (m) adapter (HP part number 1250-1534).

75Ω Matching Transformer

The HP 11694A allows you to make measurements in 75Ω systems while retaining amplitude calibration. It is effective over a frequency range of 3 to 500 MHz.
Analyzers Covered by This Manual

This manual applies to analyzers with the serial number prefixes listed under "Serial Numbers" on the title page.

Serial Numbers

Hewlett-Packard makes frequent improvements to its products to enhance their performance, usability, or reliability, and to control costs. Hewlett-Packard service personnel have access to complete records of design changes to each type of equipment, based on the equipment’s serial number. Whenever you contact Hewlett-Packard about your analyzer, have the complete serial number available to ensure obtaining the most complete and accurate information possible.

A Mylar serial number label is attached to the rear of the analyzer. The serial number has two parts: the prefix (the first four numbers and a letter), and the suffix (the last five numbers). See Figure 1-2.

![Typical Serial Number Label](image)

**Figure 1-2. Typical Serial Number Label**

The first four numbers of the prefix are a code that identifies the date of the last major design change that is incorporated in your analyzer. The letter identifies the country in which the unit was manufactured. The five-digit suffix is a sequential number and is different for each unit. Whenever you list the serial number or refer to it in obtaining information about your analyzer, be sure to use the complete number, including the full prefix and the suffix.
Specifications and Characteristics

Specifications describe the warranted analyzer performance over the temperature range of 0° to +55°C, unless stated otherwise. All specifications apply after the unit has reached a stable operating temperature as defined by the Temperature Stability Specification, and when functions are coupled (Auto Couple) key, and after calibration routines have been run, if required.

Characteristics provide useful information in the form of typical, nominal, or approximate values for analyzer performance.

Specifications

The HP 8590A specifications are listed in Table 1-1.

![Diagram of dimensions]
Preparation for Use

What You'll Find in This Chapter

This chapter describes the process of getting the HP 8590A ready to use. The process includes initial inspection procedures, setting up the unit for the selected ac power source, and performing automatic calibration routines and a confidence test to indicate that the unit is operating correctly.

Getting Ready

Initial Inspection

Inspect the shipping container for damage. If the shipping container or cushioning material is damaged, keep it until you have verified that the contents are complete and you have tested the analyzer mechanically and electrically.

The contents of the shipment should be as shown in Figure 2-1 and its accompanying legend. If the contents are incomplete or if the analyzer does not pass the operation verification tests (procedures are provided in Chapter 3), notify the nearest Hewlett-Packard office. If the shipping container is damaged or the cushioning material shows signs of stress, also notify the carrier. Keep the shipping materials for the carrier's inspection. The Hewlett-Packard office will arrange for repair or replacement without waiting for a claim settlement.

If the shipping container and cushioning material are in good condition, retain them for possible future use. You may wish to ship the analyzer to another location or return it to Hewlett-Packard for service. Chapter 4, "If Something Goes Wrong ....", provides instructions for repackaging and shipping the analyzer.
Figure 2-1. HP 8590A Shipping Container and Contents

Preparing the HP 8590A for Use

The HP 8590A is a portable instrument and requires no physical installation other than connection to a source of ac power.

Caution  
*Do not* connect ac power until you have verified that the line voltage is correct, the proper fuse is installed, and the line voltage selector switch is properly positioned, as described in the following paragraphs. Damage to the equipment could result.

Note  
If you want to install your HP 8590A in an HP System II cabinet or a standard 19 inch (486.2 mm) equipment rack, complete instructions are provided in a Service Note that is included with Options 908 and 909 Rack Mounting Kits.
Power Requirements

The power requirements for the HP 8590A are listed in Table 2-1.

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input Voltage</td>
<td>86 to 127, or 195 to 253 V rms</td>
</tr>
<tr>
<td>Frequency</td>
<td>47 to 66 Hz</td>
</tr>
<tr>
<td>Power</td>
<td>160 VA max</td>
</tr>
</tbody>
</table>

Setting the Line Voltage Selector Switch

Caution  Before connecting the HP 8590A to the power source, you must set the rear-panel voltage selector switch correctly to adapt the HP 8590A to the power source. An improper selector switch setting can damage the analyzer when it is turned on.

Set the instrument’s rear panel voltage selector switch to the line voltage range (115 V or 230 V) corresponding to the available ac voltage. See Figure 2-2. Insert a small screwdriver or similar tool in the slot and slide the switch up or down so that the proper voltage label is visible.

Figure 2-2. Setting the Voltage Selector Switch
Checking the Fuse

Note

The ac line input fuse is the same value regardless of the input line voltage. It is a fast-blow fuse, rated at 6.3 A, 250 V; its HP part number is 2110-0703.

The line fuse is housed in a small container immediately above the rear-panel power connector (see Figure 2-3). The container provides space for storing a spare fuse, as shown in the figure.

To check the fuse, insert the tip of a screwdriver in the slot at the bottom of the container and pry gently to remove the container. If the fuse is defective or missing, install a new fuse in the proper position and reinsert the fuse container.

Figure 2-3. Checking the Line Fuse
Power Cable

The HP 8590A is equipped with a three-wire power cable, in accordance with international safety standards. When connected to an appropriate power line outlet, this cable grounds the instrument cabinet.

Warning

Failure to ground the analyzer properly can result in personal injury. Before turning on the HP 8590A, you must connect its protective earth terminals to the protective conductor of the main power cable. Insert the main power cable plug only into a socket outlet that has a protective earth contact. DO NOT defeat the earth-grounding protection by using an extension cable, power cable, or autotransformer without a protective ground conductor. If you are using an autotransformer, make sure its common terminal is connected to the protective earth contact of the power source outlet socket.

Various power cables are available to connect the HP 8590A to the types of ac power outlets unique to specific geographic areas. The cable appropriate for the area to which the analyzer is originally shipped is included with the unit. You can order additional ac power cables for use in different areas. Table 2-2 lists the available ac power cables, illustrates the plug configurations, and identifies the geographic area in which each cable is appropriate.

Turning the HP 8590A On for the First Time

When you turn the analyzer on for the first time, you should perform frequency and amplitude calibration routines to calibrate the unit and a confidence test that indicates that the unit generally is functioning correctly. These are automatic self-tests that are completed in less than 15 minutes and require no external test equipment.

Perform the following steps:

1. Press [LINE].

After a few seconds, the screen displays the analyzer’s model number (HP 8590A), and the firmware date (for example, 10.9.86 indicates September 10, 1986).

| Note | Record the firmware date and keep it for reference. If you should ever need to call Hewlett-Packard for service or with any questions regarding your analyzer, it will be helpful to have the firmware date readily available. |

If your analyzer is equipped with Option 021 (HP-IB interface) or Option 022 (HP-IL interface), the appropriate interface address (HP-IB ADRS: XX or HP-IL ADRS: XX) also appears on the screen. If your analyzer is equipped with Option 023 (RS-232 interface), the baud rate (RS232: XXXX) is displayed.

2. Allow the analyzer to warm up in accordance with the Temperature Stability specification in Table 1-1.

3. Connect a 50Ω coaxial cable (such as HP 10502A) between the front-panel CAL OUTPUT and RF INPUT connectors. *(Option 001: use HP part number 5062-6452, 75Ω; coaxial cable.)*

| Warning | Do not connect 50Ω cables or adapters to the Option 001, 75Ω RF INPUT or CAL OUTPUT connectors. Damage to the 75Ω connectors will occur. |

4. Perform the frequency calibration routine by pressing [CAL] and [CAL FREQ]. During the routine, CAL: SWEEP, CAL: FREQ, CAL: SPAN, and CAL: SWEEP DELAY are displayed as the sequence progresses. CAL: DONE appears when the routine is completed. Any failures or discrepancies produce a message on the screen; see Appendix A, “HP 8590A Messages.”
5. Perform the amplitude calibration routine by pressing CAL AMPTD.

During the routine, CAL; AMPTD, CAL: 3 dB BW, CAL: ATTEN, and CAL: LOGAMP are displayed as the sequence progresses. CAL: DONE appears when the routine is completed. Any failures or discrepancies produce a message on the screen; see Appendix A, "HP 8590A Messages."

6. When the frequency and amplitude calibration routines have been completed successfully, store the data by pressing CAL STORE.

The calibration routines calibrate the analyzer by generating correction factors. CAL STORE stores the calibration correction factors in nonvolatile memory; the analyzer will automatically apply these factors in future measurements.

7. Perform a confidence test by pressing CAL, MORE, CONF TEST.

The analyzer performs a self-test by cycling through its major functions. The test is performed within 1 to 2 minutes. If the unit does not function properly, a message appears on the screen; see Appendix A, "HP 8590A Messages."

When the calibration routines and the confidence test have been completed successfully, the analyzer is ready for normal operation.
Performance Tests

What You'll Find in This Chapter

This chapter contains test procedures which test the electrical performance of the HP 8590A Spectrum Analyzer.

None of the performance tests require access to the interior of the analyzer.

What is Performance Verification?

The entire collection of procedures in this chapter test the analyzer's electrical performance using the specifications of Table 1-1.

You must complete 14 tests to verify that analyzer performance meets all the specifications. The Installation Manual contains all tests that constitute Performance Verification. The first five tests in this chapter cover Operation Verification; the entire chapter covers Performance Verification, of which Operation Verification is a subset. Table 3-1 lists all the tests and indicates test type and number. You must do the tests in the order shown in the table.

What is Operation Verification?

Operation Verification verifies that performance is within the most critical specifications of Table 1-1. The following tests are included in Operation Verification:

- Frequency Readout Accuracy
- Displayed Average Noise
- Frequency Response Flatness
- Calibrator Amplitude and Frequency Accuracy
- Frequency Span Readout Accuracy

Operation Verification takes less than 1 hour. You can use Operation Verification as a quick incoming inspection test or as a partial calibration test. If the analyzer passes Operation Verification, there is an 80% confidence level that it meets all its specifications.

An even quicker test of the spectrum analyzer's basic ability to function is called the Confidence Test. This test is described in the “Turning the HP 8590A On for the First Time” section in Chapter 2, “Preparation for Use.”

The highest-level test, called a Performance Verification test, is an in-depth test that verifies that performance is within all specifications of Table 1-1. This test is time-consuming and requires extensive test equipment.

None of the Operation Verification test procedures involve removing the cover of the spectrum analyzer.
Before You Start Verification Tests

There are four things you must do before starting:

1. Switch the analyzer on and let it warm up in accordance with the Temperature Stability specification in Table 1-1.

2. Read Chapter 1 of the Operating Manual, "Making Your First Measurement."

3. After the analyzer has warmed up as specified, perform the Calibration Procedure documented in "Making Your First Measurement." The performance of the analyzer is only specified after the analyzer calibration routines have been run and if the analyzer is auto-coupled.

4. Read the rest of this section before you start any of the tests, and make a copy of the Operation or Performance Verification Test Record described below.

Test Equipment You'll Need

Table 3-2 lists the recommended test equipment for Operation Verification. Table 3-3 lists the recommended test equipment for Performance Verification. Any equipment that meets the critical specifications given in the tables can be substituted for the recommended model(s).

Accessories You Should Have

Table 3-4 lists accessories used during Operation and Performance Verification.

Recording the Test Results

A small test results table is provided at the end of each test procedure for your convenience in recording test results as you perform the procedure.

In addition, a complete Operation Verification Test Record form is provided as Table 3-11, and a complete Performance Verification Test Record is provided as Table 3-18. We recommend that you make a copy of these tables, record the complete test results on the copies, and keep the copies for your calibration test record. This record could prove valuable in tracking gradual changes in test results over long periods of time.

If the Analyzer Doesn't Meet Specifications

If the analyzer doesn't meet one or more of the specifications, complete any remaining Operation Verification tests and record all test results on a copy of the test record. Then refer to Chapter 4, "If Something Goes Wrong ... ," for instructions on how to solve the problem.

Periodically Verifying Operation

The analyzer requires periodic verification of operation. Under most conditions of use, you should test the analyzer at least once a year with either Operation Verification or the Performance Verification Tests.

* The following alternate models can be used in place of the HP 8340A, as indicated, however, range limitations in their critical specifications may prevent complete testing:

1. For Frequency Readout Accuracy Test: HP 8640B AM/FM Signal Generator with Option 002 Doubler; frequency range: 500 kHz to 1024 MHz.

2. For Frequency Response Flatness Test: HP 8350A/83522A Sweep Oscillator; output flatness: $<\pm 0.6$ dB.

3. For both tests 1 and 2: HP 8642B Signal Generator; frequency range: 100 kHz to 2115 MHz

1. Frequency Readout Accuracy

This test verifies the analyzer’s ability to measure the frequency of a single CW signal. The test requires a synthesized frequency source that has better frequency accuracy than the HP 8590A. Note that two different Hewlett-Packard synthesized sources are recommended to cover the specified frequency range of the analyzer. The following steps summarize the Frequency Readout Accuracy test:

- Inject a 50 MHz CW signal from a synthesized source into the RF INPUT of the analyzer.
- Position the marker on the signal peak.
- Compare the analyzer’s marker frequency to the specification.
- Repeat the preceding steps for source frequencies of 100, 500, 1000, and 1500 MHz.

Specification

±(5 MHz + 1% of frequency span)

Equipment

Synthesized Sweeper ................................................................. HP 8340A

Adapter, Type N (m) to BNC (f) ............................................. HP part number 1250-0780
Adapter, 75Ω; Type N (f) to 75Ω; BNC (m) ....................... HP part number 1250-1534
1. Frequency Readout Accuracy

Test Procedure

1. Connect the RF OUTPUT of the HP 8340A Synthesized Sweeper to the RF INPUT of the HP 8590A Spectrum Analyzer with a BNC cable. (Option 001: Use MLA with adapters.)

2. Set the HP 8340A output to 50 MHz and -10 dBm with no modulation (Option 001: -4 dBm).

3. Press the following spectrum analyzer keys:
   - [Preset] (wait until the preset is complete)
   - [Frequency] 50 MHz
   - [Peak Search] [Signal Track]
   - [Span] 10 MHz

4. Record the analyzer's frequency reading in Table 3-5, Frequency Readout Accuracy Test Results, and in Table 3-11, Operation Verification Test Record.

5. Repeat steps 2, 3, and 4 for the frequencies shown in the test record. Press [Peak Search] to center the signal.

</tbody>
</table>
2. Displayed Average Noise

This test measures the noise generated by the circuits of the HP 8590A Spectrum Analyzer. This noise, called average noise, affects the analyzer's ability to measure small signals. The lower the average noise level, the greater the sensitivity and dynamic range.

This test uses the marker to measure the displayed noise with no input signal present. Since the noise measured by this test is internal to the analyzer, it is not affected by the input attenuator. However, the input attenuator setting is coupled to the displayed amplitude level. Therefore, the input attenuator must be set to 0 dB to get an accurate amplitude reading of the noise.

The following steps summarize this test:

- Connect a 50Ω load to the RF INPUT of the analyzer. (Option 001: Use a 75Ω load.)
- Set the analyzer to the specified settings and use the marker to measure the noise.

Specification

Maximum average noise level with 0 dB input attenuation, 1 kHz resolution bandwidth, and 30 Hz video bandwidth:

\[-114 \text{ dBm for frequencies } >1 \text{ MHz to 1.3 GHz}\]
\[-112 \text{ dBm for frequencies } >400 \text{ kHz to 1.5 GHz}\]
\[-59.5 \text{ dBmV for frequencies } >1 \text{ MHz to 1.3 GHz} \text{ (Option 001)}\]
\[-57.5 \text{ dBmV for frequencies } >1 \text{ MHz to 1.5 GHz} \text{ (Option 001)}\]
\[-94 \text{ dBm for frequencies } >1.5 \text{ GHz to 1.79 GHz} \text{ (Option H18)}\]
\[-39.5 \text{ dBmV for frequencies } >1.5 \text{ GHz to 1.79 GHz} \text{ (Option 001/H18)}\]

Test Procedure (Standard Only)

1. Connect the 50Ω termination to the RF INPUT of the HP 8590A Spectrum Analyzer.
2. Press the following analyzer keys:

- **Preset** (wait until the preset is complete)
- **Span** 0 Hz
- **Sweep BW** Res BW 1 kHz
- **VID BW** 30 Hz
- **Sweep Time** 5 sec
- **Amplitude** 80 dBm
- **ATTEN** 0 dBm
- **Frequency** 400 kHz (standard only)
3. Press the following analyzer keys:

```
SGL SWP
TRACE CLEAR WRITE A
VID AVERAGE 10 Hz
```

Wait until AVG 10 is displayed to the left of the graticule (the analyzer will take 10 sweeps, then stop).

4. Press [PEAK SEARCH] and record the MKR frequency as the Measurement Frequency for 400 kHz.

5. Repeat steps 3 and 4 for the analyzer frequencies (1 MHz, 750 MHz, and 1500 MHz) shown in Table 3-6.

6. Record the test results in Table 3-6, Displayed Average Noise, and in Table 3-11, Operation Verification Test Record.

3. Frequency Response Flatness

This test measures the analyzer's ability to accurately compare the amplitudes of two signals of different frequencies (for example, a two-tone intermodulation measurement) or to compare the amplitudes of two related signals of unequal amplitude (for example, carriers and sidebands).

A synthesized sweeper is used for this test because its flatness is relatively better than the analyzer's. The sweeper sweeps a signal through the band of the analyzer while the analyzer is in MAX HOLD A. This procedure traces the flatness of the analyzer on the analyzer's screen. Two different synthesized sweepers are used to cover the entire frequency range of the analyzer.

Specification (with 10 dB of input attenuation)

Absolute Reference

10 kHz to 1500 MHz (Option 001: 1 MHz to 1500 MHz)
<±1.5 dB referenced to a 300 MHz, −10 dBm signal
<±3.0 dB referenced to a 300 MHz, −10 dBm signal (Option H18: 1500 MHz to 1790 MHz)

Peak Variation (Flatness)

<±1.0 dB referenced to a midpoint between the highest and lowest amplitude excursions
<±2.0 dB referenced to a midpoint between the highest and lowest amplitude excursions (Option H18: 1500 MHz to 1790 MHz)

Equipment

Frequency Synthesizer ............................................. HP 3335A
Synthesized Sweeper ..................................................... HP 8340A
Power Meter ................................................................. HP 436A
Power Sensor ................................................................. HP 8482A
Power Splitter ............................................................... HP 11667A
BNC cable (3 required) .................................................... HP 10503A
Output adapters for HP 8340:
SMA (f) to SMA (f) .......................................................... HP part number 1250-1158
SMA (m) to BNC (f) .......................................................... HP part number 1250-1200
Adapters for HP 11667A:
Type N (m) to BNC (f) (2 required) ............................. HP part number 1250-0780
Type N (m) to BNC (m) ...................................................... HP part number 1250-0082
3. Frequency Response Flatness

Additional Equipment for Option 001

- Power Meter ................................................................. HP 436A
- Power Sensor ............................................................... HP 8483A
- Cable, BNC, 120 cm (48 in), 75Ω ................................ HP part number 15525-80010
- Mechanical Adapter, Type N (f) 75Ω to Type N (m) 50Ω ...... HP part number 1250-0597
- Adapter Type N (m) to BNC (m) 75Ω ............................ HP part number 1250-1533

Test Procedure: 10 kHz to 10 MHz (Option 001: 1 MHz to 10 MHz)

1. Press the following keys on the analyzer:
   - [PRESSET] (wait until the preset is complete)
   - [FREQUENCY] 5.01 MHz (Option 001: 5.5 MHz)
   - [DISPLAY] DISPLAY UNITS dBm (Option 001 only)
   - [AMPERATURE] 6 dBm
   - [SPAN] 2 MHz

2. Set the HP 3335A Frequency Synthesizer to a CW output of 5.01 MHz at −10 dBm. Connect the equipment as shown in Figure 3-1.
   (Option 001 only: Set CW to 5.5 MHz and power to −10 dBm and output switch to 75Ω. Connect the HP 3335A 75Ω output to the RF input using the 75Ω BNC cable.)

3. Tune the HP 8590A to place the signal at the center of the analyzer's screen. Set the sweep width of the frequency synthesizer and the SPAN of the HP 8590A to 10 MHz.
   (Option 001 only: Set sweep width of the HP 3335A and the HP 8590A to 9 MHz.)

4. Press [LOG] dB/DIV 1 +dBm on the analyzer. Adjust the output power of the frequency synthesizer to place the signal at approximately midscreen.

7. Press [PEAK SEARCH] MARKER DELTA and rotate the knob to locate the minimum power point in the response curve. Note the marker delta reading in dB. To calculate the midpoint of the trace variation divide the marker delta reading by 2.

8. The frequency response flatness is the maximum peak-to-peak trace variation on the spectrum analyzer's screen. This variation should be less than ±1.0 dB referenced to the midpoint between the highest and lowest amplitude excursions.

9. Record the test results on copies of Table 3-7, Frequency Response Flatness, and Table 3-11, Operation Verification Test Record.
3. Frequency Response Flatness

![Diagram of frequency response flatness test setup]

10 kHz to 10 MHz
OPT 001 & 001/H18: 1 MHz to 10 MHz

![Diagram of frequency response flatness test setup]

10 MHz to 1500 MHz
OPT H18: 1500 MHz to 1790 MHz

Figure 3-1. Frequency Response Flatness Test Setup

Test Procedure: 10 MHz to 1500 MHz (Option H18: 1500 MHz to 1790 MHz)

1. Press the following keys on the analyzer:

   - [Preset] (wait until the preset is complete)
   - [Frequency]
   - Start Freq: 10 MHz
   - Stop Freq: 1500 MHz
   - Amplitude: 6 dBm
   - Log dB/Div: 1 dBm

3-16 Performance Tests
2. Set the HP 8340A Synthesized Sweeper to CW 300 MHz, then set the power level to -4 dBm.

3. Calibrate the power meter.

4. Connect the equipment as shown in Figure 3-1.

5. Switch the HP 436A range to hold. On the HP 8340A, switch leveling to meter and, if necessary, adjust the output power of the synthesized sweeper to position the 300 MHz signal four divisions down from the analyzer's reference level. NOTE: Ignore meter flutter; it is normal.

6. Set the synthesized sweeper's start frequency to 10 MHz and the stop frequency to 1500 MHz. Set the sweep time to 100 seconds and set sweep to single (sweep LED out).

7. On the analyzer, press [TRACE A] and [MAX HOLD A].

8. On the synthesized sweeper, press SINGLE SWEEP to start and complete one sweep.

10. Press [PEAK SEARCH] [MARKER DELTA] and adjust the tuning knob to place the delta marker at the lowest point on the trace.

11. Read the amplitude difference (direct readout displayed in both the active function block and marker readout areas of the screen). Press [MKR], [MARKERS OFF].

12. The frequency response flatness is the maximum peak-to-peak trace variation on the spectrum analyzer's screen. This variation should be less than ±1.0 dB, referenced to the midpoint between the highest and lowest amplitude excursions.

13. Record the test results on copies of Table 3-7, Frequency Response Flatness, and Table 3-11, Operation Verification Test Record.

14. Option H18 only: Press [TRACE A] [CLEAR WRITE A] [MKR] [MARKERS OFF] and repeat steps 6 through 13 for frequency start/stop settings of 1500 to 1790 MHz.

3. Frequency Response Flatness

Procedure for System Characterization, Option 001 Only

1. Zero and calibrate the HP 8902A and HP 8482A as described in the HP 8902A Operation Manual.

3. Press \texttt{INSTR PRESET} on the HP 8340A/B. Set the HP 8340A/B controls as follows:
   
   \begin{itemize}
   \item \texttt{CW} \hspace{1cm} 10 \text{ MHz}
   \item \texttt{FREQ STEP} \hspace{1cm} 50 \text{ MHz}
   \item \texttt{POWER LEVEL} \hspace{1cm} 5 \text{ dBm}
   \end{itemize}

4. Connect the equipment as shown in Figure 3-2.

\begin{figure}
\centering
\includegraphics[width=\textwidth]{figure_3-2.png}
\caption{System Characterization Test Setup (Option 001)}
\end{figure}
5. Adjust the HP 8340A/B power level for a 0 dBm reading on the HP 8902A.

6. Record the HP 436A reading in column 3 of Table 3-8, taking into account the Cal Factors of both the HP 8482A and the HP 8483A.

7. On the HP 8340A/B, press \( \text{CW} \ 50 \ \text{MHz} \), and then \( \text{A} \) (step up), to step through the remaining frequencies listed in Table 3-8.

   At each new frequency repeat steps 5 and 6, entering each power sensor's Cal Factor into the respective power meter.

**Test Procedure**

**Option 001: 10 MHz to 1500 MHz (Option 001/H18: 1500 MHz to 1790 MHz)**

1. Zero and calibrate the HP 8902A and HP 8482A in log mode as described in the HP 8902A Operation Manual.

2. Connect the equipment as shown in Figure 3-3.

![Figure 3-3. Frequency Response Test Setup](image)
3. Frequency Response Flatness

3. Press [INSTR PRESET] on the HP 8340A/B. Set the HP 8340A/B controls as follows:
   - CW ......................................................... 300 MHz
   - FREQ STEP ........................................ 50 MHz
   - POWER LEVEL ........................................... –4 dBm

4. On the analyzer, press [PRESET] and wait for the preset to finish. Press [FREQUENCY]. Set the analyzer's controls as follows:
   - CENTER FREQUENCY ................................ 300 MHz
   - CF STEP ........................................ 50 MHz
   - SPAN ..................................................... 10 MHz
   - Press [DISPLAY] DISPLAY UNITS dBm.
     - REF LEVEL ........................................ –6 dBm
     - LOG dB/DIV .......................................... 1 dB
     - RES BW ............................................... 1 MHz
     - VIDEO BW ........................................... 3 kHz

5. On the analyzer, press [PEAK SEARCH], [SIGNAL TRACK] (ON).

6. Adjust the HP 8340A/B power level for a MKR-TRK amplitude reading of –10 dBm ±0.05 dB.

7. Set the sensor Cal Factor on the HP 8902A and then press [RATIO] on the HP 8902A.

8. Set the HP 8340A/B CW to 10 MHz.

9. Set the analyzer center frequency to 10 MHz.

10. Adjust the HP 8340A power level for an analyzer MKR-TRK amplitude reading of –10 dBm ±0.05 dB.

11. Set the sensor Cal Factor on the HP 8902A and record the negative of the power ratio in Table 3-8.

12. Set the HP 8340A/B CW to 50 MHz.

13. Set the analyzer center frequency to 50 MHz.

14. Adjust the HP 8340A/B power level for an analyzer MKR-TRK amplitude reading of –10 dBm ±0.05 dB.

15. Set the sensor Cal Factor on the HP 8902A and record the negative of the power ratio displayed on the HP 8902A in Table 3-8 as the Error Relative to 300 MHz.

16. On the HP 8340A/B, press [CW] and [▲], and on the analyzer, press [FREQUENCY] and [▲], to step through the remaining frequencies listed in Table 3-8. At each new frequency, repeat steps 14 through 16, entering the power sensor’s Cal Factor into the HP 8902A as indicated in Table 3-8.

17. Starting with the error at 10 MHz, subtract column 4 (System Error) to column 2 (Error Relative to 300 MHz) and record the result in column 5 (Corrected Error Relative to 300 MHz). Transfer the results in column 5 to Table 3-11.

4. Calibrator Amplitude and Frequency Accuracy

This test measures the accuracy of the analyzer’s calibrator signal. The analyzer uses this signal in its calibration routines; therefore, the calibration of the analyzer depends on the accuracy of this signal.

The calibrator signal is measured directly using a power meter for amplitude accuracy, a low-pass filter to suppress harmonics above 300 MHz, and a frequency counter for frequency accuracy. (Option 001 only: Omit the low-pass filter).

**Specification**

Amplitude: $-20 \text{ dB } \pm 1.0 \text{ dB (50} \Omega \text{ calibration)}$

$+28.75 \text{ dBmV } \pm 1.0 \text{ dB (Option 001: 75} \Omega \text{ calibration)}$

Frequency: $299.9 \text{ MHz } \pm 300 \text{ kHz}$

**Equipment**

- Frequency Counter .......................................................... HP 5342A
- Power Meter ................................................................. HP 436A
- Power Sensor ............................................................... HP 8482A
- BNC cable ................................................................. HP 10503A
- 300 MHz Low-Pass Filter ........................................ HP part number 0955-0455
- Adapter, Type N (f) to BNC (m) ................................. HP part number 1250-0077
  
  **Option 001**

- Power Sensor ............................................................... HP 8483A
- BNC Cable, 75Ω ......................................................... HP part number 15525-80010
- Mechanical Adapter, 75Ω to 50Ω ................................. HP part number 1250-0597
- Adapter, Type N (f) 75Ω to BNC (m) 75Ω ................. HP part number 1250-1534

**Test Procedure**

1. Press **PRES**EAT on the HP 8590A Spectrum Analyzer.

2. Zero and calibrate the power meter and power sensor with the low-pass filter. Enter the power sensor’s 300 MHz Cal Factor into the power meter. See Figure 3-4.

   (Option 001 only: The HP 8483A power sensor is supplied with an adapter (HP part number 1250-0597) for joining the power sensor’s 75Ω Type N connector to the 50Ω power reference connector on the power meter. This accessory is a mechanical adapter only, not an impedance transformer. Therefore, an impedance mismatch exists and the meter should be calibrated to REF CF of the power mount. The specification of CAL OUTPUT is $+28.75 \text{ dBmV (dBmV = dBm } +30 \text{ +10 log 75). However, the power meter will read out the same power at standard products (that is, } -20 \text{ dBm). Add 48.75 (conversion factor dBm to dBmV) to the power reading.}
4. Calibrator Amplitude and Frequency Accuracy

3. Connect the power sensor with the low-pass filter to the CAL OUTPUT of the analyzer. (Option 001 only: Connect the HP 8483A to the CAL OUTPUT using the adapter with HP part number 1250-1534.)

4. Record the power reading on a copy of the test record. The power reading should be between the values shown on the test record.

5. Set the frequency counter input impedance to 50Ω and the gate time to MHz.

6. Connect the analyzer's CAL OUTPUT to the input of the frequency counter. (Option 001 only: Use the 75Ω BNC cable. See Figure 3-5.)

7. Record the frequency reading on the counter on copies of Table 3-9 and Table 3-11. The frequency reading should be between the values shown on the tables.

5. Frequency Span Readout Accuracy

This test measures the analyzer’s ability to read the frequency of two signals at the same time accurately. The test uses a frequency comb generator. A comb generator gets its name from the signals it generates. The signals are evenly spaced in the frequency spectrum so that they resemble the teeth of a comb.

The comb generator is used to test the wide spans (20 MHz to 1500 MHz). A signal generator is modulated with a synthesizer to generate comb signals for testing the narrow spans (50 kHz to 1 MHz).

The span readout accuracy test is summarized as follows:

- Set the comb generator frequency so that a comb tooth signal falls on each graticule (or every other graticule) of the analyzer span under test.
- Place one of the analyzer’s markers on the first comb signal from the left edge of the screen. Place the other marker on the first comb signal from the right edge of the screen.
- Read the span as the marker delta frequency and compare it to the specification.

Specifications

<±3% of indicated frequency span, 50 kHz to 1500 MHz

Equipment

Frequency Comb Generator .......................... HP 8406A  
AM/FM Signal Generator ............................. HP 8640B  
Frequency Synthesizer ............................... HP 3335A  
BNC cable (2 required) ................................ HP 10503A  
Adapter, Type N (m) to BNC (f) (2 required) .... HP part number 1250-0780  
Option 001:  
Minimum Loss Adapter ............................... HP 11852B  
Adapter, 75Ω Type N (f) to 75Ω BNC (m) ......... HP part number 1250-1534

Test Procedure (20 to 1500 MHz spans)

1. Set the HP 8406A Comb Generator to 100 MC, with the INTERPOLATION AMPLITUDE 1 MHz to off, and the OUTPUT AMPLITUDE control completely clockwise.

2. Connect the equipment as shown in Figure 3-6.
3. Press the following spectrum analyzer keys:

(PRESET) (wait until the preset is complete)

(FREQUENCY)

Use the knob to place the 300 MHz comb signal on the second graticule, then press:

(TRIG) SINGLE SWEEP

(PEAK SEARCH) NEXT PK RIGHT MARKER DELTA

Press NEXT PK RIGHT until the delta marker is on the 1400 MHz comb signal (the 1400 MHz comb should be just right of the ninth graticule).

4. Read the marker delta frequency as the frequency span. Record the span on copies of Table 3-10, Frequency Span Readout Accuracy, and Table 3-11, Operation Verification Test Record. The span should fall between the values shown on the table.

Press (MKR) MARKERS OFF (TRIG) CONT SWEEP .

5. Repeat step 4 for frequency spans of 1000, 500, 100 and 20 MHz. Press (FREQUENCY), use the knob to align a comb signal on the first graticule line. For spans of 100 MHz and 20 MHz, see note, below.

Press (TRIG) SINGLE SWEEP (PEAK SEARCH). Press NEXT PK RIGHT OR LEFT to place the marker on the comb signal aligned with the first graticule.

Press MARKER DELTA . Press NEXT PK RIGHT to place the delta marker on the comb signal nearest the ninth graticule line.

Record the marker delta frequency as the frequency span in Table 3-10.

Press (MKR) MARKERS OFF (TRIG) CONT SWEEP .

---

**Note**

In the 20 MHz span, set the analyzer attenuator to 0 dBm. In the 20 and 100 MHz spans, set the comb frequency to 1 MHz and 10 MHz, respectively. It may be necessary to change ATTEN to 0 dB in 20 MHz span.
5. Frequency Span Readout Accuracy

(a) 20- to 1500-MHz Spans

(b) 50-kHz to 1-MHz Spans

Figure 3-6. Frequency Span Readout Accuracy
Test Procedure (50 kHz to 1 MHz spans)

1. Connect the equipment as shown in Figure 3-6.

2. Set the HP 8640B Signal Generator for −10 dBm, 10 MHz, and its amplitude modulation input for ac coupling.

3. Set the HP 3335A Frequency Synthesizer to +10 dBm at 100 kHz and adjust the signal generator for 90% amplitude modulation.

4. Press the following analyzer keys:
   - **P**RESET (wait until the preset is complete)
   - **F**REQUENCY 10 **M**Hz
   - **S**PAN 1 **M**Hz **P**EAK **S**EARCH **S**IGNAL **T**RACK
   - **T**RIG SINGLE **S**WEEP **P**EAK **S**EARCH **N**EXT **P**K **L**eft(RIGHT) to set the marker on the peak of the comb signal on the first graticule line.
   - **M**ARKER **D**ELTA **N**EXT **P**K **R**IGHT to set the delta marker on the peak of the comb signal at the ninth graticule. (Note: Adjust the output level vernier on the HP 8640B to achieve optimum display of the modulation signal.)

5. Read the frequency separation as the marker delta frequency. Record the frequency separation on the copies of Table 3-10 and Table 3-11. The frequency separation should fall between the values shown on the tables (800 kHz ±30 kHz). **M**ARKERS **O**FF **T**RIGGER **C**ONT **S**WP.

6. Repeat step 4, skipping the **P**RESET and **F**REQUENCY steps, for a span of 500 kHz with the frequency synthesizer set to 50 kHz. Record the frequency separation (marker reading) (400 kHz ±15 kHz) on the copies of Table 3-10 and Table 3-11. **M**ARKERS **O**FF **C**ONT **S**WP.

7. Use the following settings to test the analyzer’s 50 and 100 kHz spans. Record the results. Continue as in step 4 and step 5.

Performance Tests 3-31
6. Sweep Time Accuracy Test

This test uses a synthesizer function generator to amplitude modulate a 500 MHz, CW signal from another signal generator. The analyzer demodulates this signal in zero span to display the response in the time domain. The marker delta frequency function of the analyzer is used to read out the sweep time accuracy.

Specification

Frequency Sweep Readout Accuracy: \(<\pm10\%\) of indicated sweep time setting.

Equipment

- Synthesizer Function Generator .............................................. HP 3325A
- Signal Generator .............................................................. HP 8640B
- BNC Cable 120 cm (48 in) (2 required) ................................. HP 10503A
- Adapter Type N (m) to BNC (f) ........................................... HP part number 1250-0780

Additional Equipment for Option 001

- Minimum Loss Adapter (MLA), 75Ω to 50Ω ............................ HP 11852B
- Adapter, Type N (m) to BNC (f) ......................................... HP part number 1250-0780
- Adapter, 75Ω Type N (f) to 75Ω BNC (m) ............................. HP part number 1250-1534

Test Procedure

1. Set the signal generator to output a 500 MHz, \(-10\) dBm, CW signal. Set the AM and FM controls OFF. (Option 001: Set the output to \(-4\) dBm.)

2. Set the synthesizer function generator to output a 500 Hz, \(+5\) dBm, triangle waveform signal.

3. Connect the equipment as shown in Figure 3-7.

Note

The lower the function generator output level, the narrower the displayed pulse on the analyzer CRT. If the function generator frequency setting is decreased to 1 Hz or lower, it may be necessary to increase the function generator output to \(+10\) dBm to display an adequate signal on the analyzer CRT. The signal generator output and the percentage of AM modulation may also need to be increased.
4. Press [Preset] on the analyzer and wait for the preset to finish. Set the controls as follows:

   FREQUENCY .............................................. 500 MHz
   SPAN ...................................................... 10 MHz

Press [Peak Search]. Set the controls as follows:

   SIGNAL TRACK ........................................... ON
   SPAN ...................................................... 50 kHz

Wait for the AUTO ZOOM routine to finish. Press [Signal Track] OFF [Span] ZERO SPAN.

Set the controls as follows:

   BW ............................................................. 3 MHz
   AMPLITUDE SCALE ....................................... LINEAR
   SWEEP TIME ............................................. 20 ms

5. Set the signal generator AM switch to the AC position.

6. On the analyzer, press [Trig] VIDEO.

   Adjust the video trigger so that the analyzer is sweeping.
6. Sweep Time Accuracy Test

7. Press [SGL SWP]. After the completion of the sweep, press [PEAK SEARCH]. If necessary, press [NEXT PEAK] until the marker is on the leftmost signal. This is the "marked signal."

8. Press [MARKER DELTA], [MARKER DELTA] and press [NEXT PK RIGHT] until the marker delta is on the eighth signal peak. Record the marker delta reading in Table 3-12 and Table 3-18. Press [MKR MARKERS OFF [TRIG] CONT SWEEP].

9. Repeat steps 6 through 9 for the remaining sweep time settings listed in Table 3-12 and Table 3-18.

Table 3-12. Sweep Time Accuracy Settings

7. Noise Sideband Test

A 500 MHz, CW signal is applied to the analyzer RF input. The signal sidebands are examined for noise amplitude and unwanted responses.

Specifications

Noise sideband levels: \(<-65 \text{ dB} \text{ down and }>30 \text{ kHz offset from CW signal with } 1 \text{ kHz resolution and } 30 \text{ Hz video bandwidth.}\\

Equipment

Signal Generator .......................................................... HP 8640B
BNC Cable, 120 cm (48 in) .............................................. HP 10503A

Additional Equipment for Option 001

Minimum Loss Adapter, 75Ω to 50Ω ..................................... HP 11852B
BNC Cable, 30 cm (37 in), 75Ω ................................. HP part number 15525-80010
Adapter, Type N (m) to BNC (f) ................................. HP part number 1250-0780
Adapter, 75Ω Type N (f) to 75Ω BNC (m) ............... HP part number 1250-1534

Test Procedure

1. Set the signal generator to output the 500 MHz, \(-0 \text{ dBm}, \text{CW signal. Set the AM and FM controls OFF, and the RF control ON.}\\

2. Connect the equipment as shown in Figure 3-8. If your analyzer has Option 001 (75Ω RF input), connect the 75Ω side of the minimum loss adapter to the RF input of the analyzer, and connect the 50Ω cable from the signal generator to the 50Ω side of the minimum loss adapter.

3. Press the following analyzer keys:

   - [PRES] (wait until preset is complete)
   - [PEAK SEARCH]
   - [SIGNAL TRACK]
   - [SPAN] 100 kHz
   - [DISPLAY] DISPLAY UNITS dBm
   - [MRK→ MARKER→RL]
   - [SIGNAL TRACK OFF]
   - [Sweep BW] RES BW 1 kHz
   - [VID BW 30 Hz]
   - [PEAK SEARCH] MARKER→CF
   - [TRIG]
   - [SINGLE SWEEP]
   - [PEAK SEARCH] MARKER DELTA

Move the marker delta using the knob and measure the frequency and amplitude of every sideband. The marker delta reading should be \(<-65 \text{ dBc for signals }>30 \text{ kHz offset from the CW signal.}\\

Performance Tests 3-35
4. Record the Noise Sideband highest levels below and in Table 3-18.

      \[ \text{________________________} \leq -65 \text{ dBC} \]
8. Spurious Response Test

This test is performed in two parts. The first part measures second harmonic distortion; the second part measures third order intermodulation distortion.

To test second harmonic distortion, a 50 MHz low-pass filter is used to filter the source output, ensuring that harmonics read by the analyzer are internally generated and not coming from the source. To measure the distortion products, the power at the mixer is set 25 dB higher than specified. New test limits have been developed based on this higher power.

With −45 dBm at the input mixer and the distortion products suppressed by 70 dBc, the equivalent second-order intercept (SOI) is +25 dBm (−45 dBm plus 70 dBc). Therefore, with −20 dBm at the mixer, and the distortion products suppressed by 45 dBc, the equivalent SOI is also +25 dBm (−20 dBm plus 45 dBc).

For third order intermodulation distortion, two signals are combined in a directional bridge (for isolation) and are applied to the analyzer input. The power level of the two signals is 8 dB higher than specified, so the distortion products should be suppressed by 16 dB less than specified. In this manner, the equivalent third-order intercept (TOI) is measured.

With two −30 dBm signals at the input mixer and the distortion products suppressed by 70 dBc, the equivalent TOI is +5 dBm (−30 dBm plus 70 dBc/2). However, if two −22 dBm signals are present at the input mixer and the distortion products are suppressed by 54 dBc, the equivalent TOI is also +5 dBm (−22 dBm plus 54 dBc/2).

Performing the test with a higher power level maintains the measurement integrity while reducing both test time and the dependency on the source's noise sideband performance.

Specification

Second Harmonic Distortion:

<−70 dBc, Frequencies >5 MHz (−45 dBm at input mixer)
<−60 dBc, Frequencies ≤5 MHz

Third Order Intermodulation Distortion:

<−70 dBc, 5 MHz to 1.5 GHz, for two −30 dBm tones at input mixer and >50 kHz signal separation.
<−60 dBc for 100 kHz to 5 MHz signals

Equipment

Synthesizer/Level Generator ............................................. HP 3335A
Synthesized Sweeper ....................................................... HP 8340A
Measuring Receiver (or Power Meter) ............................... HP 8902A (HP 436A)
Power Sensor, 100 kHz to 4.2 GHz ...................................... HP 8482A
50 MHz Low-Pass Filter ................................................ HP part number 0955-0306
Directional Bridge .......................................................... HP 8721A
BNC Cable, 120 cm (48 in) (2 required) .............................. HP 10503A
8. Spurious Response Test

Adapter, SMA (f) to SMA (f) ........................................ HP part number 1250-1158

Adapter, N(m) to BNC(f) ........................................... HP part number 1250-0780

Test Procedure

Second Harmonic Distortion, 40 MHz

1. Set the HP 3335A controls as follows:

   FREQUENCY .................................................. 40 MHz
   AMPLITUDE .................................................. −10 dBm
   AMPLITUDE (Option 001) ............................. −4.3 dBm

2. Connect the equipment as shown in Figure 3-9.

   (Option 001: Connect the HP 11852B between the low-pass filter and INPUT 75Ω.)

![Diagram of test setup](image-url)

Figure 3-9. Second Harmonic Distortion Test Setup, 30 MHz
3. Press [Preset] on the analyzer and wait for the preset to finish. Set the controls as follows:
   CENTER FREQUENCY .................................................. 40 MHz
   SPAN ................................................................. 10 MHz
   Option 001: Press [DISPLAY] DISPLAY UNITS [dBm]
   Ref Level ............................................................ −10 dBm
   Press [Peak Search] SIGNAL TRACK (ON) SPAN 1 MHz BW 30 kHz.

4. Adjust the HP 3335A amplitude to place the peak of the signal at the reference level
   (−10 dBm, ±0.2 dB). Press [SIGNAL TRACK] OFF.

5. Set the analyzer control as follows:
   RES BW .............................................................. 10 kHz
   VIDEO BW .......................................................... 300 Hz

   SIGNAL TRACK (FREQUENCY) CF STEP SIZE 40 MHz (FREQUENCY).

7. Press the A (step up) key on the analyzer to step to the second harmonic (at 80 MHz).
   Press [Peak Search]. Record the marker delta amplitude reading here and on Table 3-18.

   Note
   If necessary, increase SPAN to 5 MHz to acquire the signal, press [Peak Search] and SPAN 1 MHz.

8. Repeat steps 3 through 7 setting the Level Generator to 2 MHz and checking the second
   harmonic at 4 MHz. (Set marker CF step size to 2 MHz.)

   ____________________________ < −45 dBC
8. Spurious Response Test

Third Order Intermodulation Distortion, 50 MHz

1. Zero and calibrate the HP 8902A and HP 8482A combination in log mode (RF power readout in dBm). Enter the power sensor's 50 MHz Cal Factor into the HP 8902A.

*(Option 001: Calibrate the HP 8483A 75Ω power sensor.)*

2. Connect the equipment as shown in Figure 3-10 with the output of the directional bridge connected to the power sensor.

*(Option 001: Use the HP 8483A power sensor with a Type N (f) to BNC (m) 75Ω adapter (HP part number 1250-1534) and use a BNC (m) to BNC (m) 75Ω adapter (HP part number 1250-1288) in place of the 50Ω adapter.)*

---

**Note**

*(Option 001: The power measured at the output of the 50Ω directional bridge by the 75Ω power sensor is the equivalent power "seen" by the 75Ω analyzer.)*

---

![Diagram of equipment setup](image)

*Figure 3-10. Third Order Intermodulation Distortion Test Setup*
3. Press [INSTR PRESET] the HP 8340A. Set the HP 8340A controls as follows:
   - POWER LEVEL ..................................................... $-6 \text{ dBm}$
   - CW ................................................................. 50 MHz
   - RF ................................................................. OFF

4. Set the HP 3335A controls as follows:
   - FREQUENCY ..................................................... 50.050 MHz
   - AMPLITUDE ...................................................... $-6 \text{ dBm}$
   - 50$\Omega$/75$\Omega$ switch ........................................ $75\Omega$ (no RF output)

5. On the analyzer, press [PRESET] and wait until the preset is finished. Set the controls as follows:
   - CENTER FREQUENCY ............................................ 50 MHz
   - SPAN ............................................................... 10 MHz
   - (Option 001: Press [DISPLAY] DISPLAY UNITS [dBm].)
   - AMPLITUDE ...................................................... $-10 \text{ dBm}$

   Press the following analyzer keys:
   - [PEAK SEARCH] PEAK EXCURS 3 dB
   - [DISPLAY] THRESHLD 90 dBm

6. On HP 8340A, set RF ON. Adjust the power level until the HP 8902A reads $-12 \text{ dBm}$ ±0.05 dB.

7. Disconnect the power sensor from the directional bridge. Connect the directional bridge directly to the analyzer’s RF INPUT using an adapter (do not use a cable).
   - (Option 001: Use a 75$\Omega$ adapter, BNC (m) to BNC (m).)

8. On the analyzer, press [PEAK SEARCH] SIGNAL TRAC (ON) [SPAN] 200 kHz. Wait for the AUTO ZOOM message to disappear. Press [SIGNAL TRAC] (OFF) [PEAK SEARCH] MKR $\rightarrow$ MARKER $\rightarrow$ RL.

9. On the HP 3335A, set the 50$\Omega$/75$\Omega$ switch to the 50$\Omega$ position (RF on). Adjust the amplitude until the two signals are displayed at the same amplitude.

10. If necessary, adjust the analyzer center frequency until the two signals are centered on the display. Set the controls as follows:

11. RES BW ........................................................... 1 kHz
    VIDEO BW ..................................................... 100 Hz

12. Press [PEAK SEARCH] [DISPLAY] DSP LINE. Set the display line to a value of 54 dB below the current reference level setting.

13. The third order intermodulation distortion products should appear 50 kHz below the lower frequency signal and 50 kHz above the higher frequency signal. Their amplitude should be less than the display line.
8. Spurious Response Test

14. If the distortion products can be seen, proceed as follows:
   a. On the analyzer, press \textit{SGL SWEEP}, wait for completion of the sweep, then press \textit{PEAK SEARCH}, \textit{MARKER DELTA}.
   b. Repeatedly press \textit{NEXT PEAK} until the active marker is on the highest distortion product.
   c. Record the marker delta amplitude reading below and in Table 3-18. The marker delta reading should be less than $-54$ dBC.

   
   Third Order Intermodulation Distortion, 50 MHz:

   \begin{center}
   \textbf{} < -54 dBC
   \end{center}

15. If the distortion products cannot be seen, proceed as follows:
   a. On both the HP 8642A and the HP 3335A, increase the power level by 5 dB. Distortion products should now by visible at this higher power level.
   b. On the analyzer, press \textit{SGL SWEEP \textbf{PEAK SEARCH MARKE}R DELTA}.
   c. Repeatedly press \textit{NEXT PEAK} until the active marker is on the highest distortion products.
   d. On both the HP 8642A and the HP 3335A, reduce the power level by 5 dB and wait for the completion of a new sweep.
   e. Record the marker delta amplitude reading below and in Table 3-18. The marker delta reading should be less than $-54$ dBC.

   
   Third Order Intermodulation Distortion, 50 MHz:

   \begin{center}
   \textbf{} < -54 dBC
   \end{center}

![Figure 3-11. Spurious Response-Intermodulation Distortion Products](image-url)
9. Residual Response Test

Residual response is checked by terminating the RF input of the analyzer, setting input attenuation to 0 dB, and measuring any residuals across the instrument’s input frequency range. The analyzer CRT is used to make the measurements.

Specification

Residual Responses:

\(-95 \text{ dBm with 0 dB input attenuation and no signal present at input (standard and Option 001.)}\
\<-88 \text{ dBm with 0 dB input attenuation and no signal present at input (Option H18 and Option 001/H18 at 1728 MHz.)}\

Equipment

50Ω Termination ....................................................... HP 11593A

Equipment for Option 001

75Ω Termination ..................................................... HP part number 11652-60010

Test Procedure

The following procedure can be completed in approximately 30 minutes with the frequency step size and span given.

1. Connect the 50Ω termination to the analyzer RF input.
    (Option 001: Connect the 75Ω termination to the RF input instead.)

2. Press the following analyzer keys:

   \begin{itemize}
   \item \textbf{PRESET} (wait until preset is complete)
   \item \textbf{FREQUENCY 25 MHz}
   \item \textbf{SPAN 50 (MHz)}
   \item (Option 001: \textbf{DISPLAY DISPLAY UNITS dBm})
   \item \textbf{AMPLITUDE 60 \(-\text{dBm}\)}
   \item \textbf{ATTEN 0 (dB)}
   \item \textbf{Sweep BW RES BW 3 (kHz)}
   \item \textbf{VID BW 1 (kHz)}
   \item \textbf{DISPLAY DISPLAY LINE 95 \(-\text{dBm}\)}
   \item \textbf{FREQUENCY CF STEP SIZE 45 (MHz) FREQUENCY}
   \end{itemize}
9. Residual Response Test

3. Press analyzer [TRIG] and SINGLE SWEEP keys, and wait for the sweep to be completed. Look for any residual responses at or above the display line on the analyzer CRT. If a residual is suspected, press the SINGLE SWEEP key again to determine if the response persists. A residual will persist on repeated sweeps, but a noise peak will not. Any residual responses must be at or below the display line. Press [PEAK SEARCH] after each sweep and note the marker reading in dBm.

4. Press the analyzer [FREQUENCY] and [A] (step up) keys to step to the next higher center frequency, which is 45 MHz above the last setting. Repeat step 3.

5. Repeat steps 3 and 4 until the complete analyzer frequency range has been evaluated (that is, until you reach the maximum frequency of 1.510 GHz). This requires 33 additional frequency steps. There should be no residual responses at or above the display line at frequencies below 1500 MHz.

6. Record the maximum residual response here and in Table 3-18.

10. Reference Level Accuracy Test

A 50 MHz CW signal is applied to the INPUT 50Ω of the analyzer through two step attenuators. The attenuators increase the effective amplitude range of the source. The amplitude of the source is decreased in 10 dB steps and the analyzer marker functions are used to measure the amplitude difference between steps. The source’s internal attenuator is used as the reference standard. The test is performed in both log and linear amplitude scales.

It is only necessary to test reference levels as low as −90 dBm (with 10 dB ATTN) since lower reference levels are a function of the analyzer microprocessor’s manipulating the trace data. There is no error associated with the trace data manipulation.

Specification

<±1.75 dB for +30 to −120 dBm range (0 to 60 dB attenuation)
<±1.25 dB for 0 to −120 dBm range (10 dB attenuation) at any fixed frequency
<±0.5 dB for ) to −59 dBm range (10 dB attenuation) at any fixed frequency

Equipment

Synthesizer/Level Generator .............................................. HP 3335A
Step Attenuator, 1 dB steps ............................................. HP 355C
Step Attenuator, 10 dB steps .......................................... HP 355D
BNC Cable, 122 cm (48 in) (2 required) ........................... HP 10503A
Adapter, BNC (m) to BNC (m) ................................. HP part number 1250-0216

Additional Equipment for Option 001

Minimum Loss Adapter .................................................... HP 11852B
Adapter, Type N (f) to BNC (m), 75Ω ................................. HP part number 1250-1534
Adapter, Type N (M) to BNC (f) ................................. HP part number 1250-0780

Test Procedure

1. Set the HP 3335A controls as follows:
   FREQUENCY .......................................................... 50 MHz
   AMPLITUDE .......................................................... −10 dBm
   AMPTD INCR ........................................................ 10 dB
   OUTPUT ............................................................... 50Ω

2. Connect the equipment as shown in Figure 3-12. Set the HP 355D to 10 dB attenuation and the 355C to 0 dB attenuation.

   (Option 001: Connect the minimum loss adapter to the INPUT 75Ω (using adapters), and set the HP 355D to 0 dB attenuation.)
10. Reference Level Accuracy Test

![Figure 3-12. Reference Level Accuracy Test Setup](image)

3. Press **Preset** on the analyzer and wait for the preset to finish. Set the controls as follows:

   CENTER FREQUENCY ........................................ 50 MHz
   SPAN ................................................................ 10 MHz
   PEAK SEARCH SIGNAL TRACK ................................. ON
   SPAN ................................................................ 50 kHz

   *(Option 001: Press **Display** DISPLAY UNITS dBm.)*

   Set the controls as follows:

   REF LEVEL ..................................................... −20 dBm
   LOG dB/DIV .................................................... 1 dB
   RES BW ....................................................... 3 kHz
   VIDEO BW ..................................................... 30 Hz

4. Set the HP 355C attenuation to place the signal peak 1 to 2 dB (one to two divisions) below the reference level.

5. On the analyzer, press the following keys:

   **SGL SWP**  **PEAK SEARCH**  **MARKER DELTA**

6. Set the HP 3335A Amplitude and HP 8590A Ref Level according to the Table 3-13. At each setting, press **SGL SWP**  **PEAK SEARCH** on the analyzer. Record the marker delta amplitude reading in Table 3-13 and Table 3-18. The marker delta reading should be within the limits shown.

11. Scale Fidelity Test

This test is performed in two parts. The first part measures log scale fidelity; the second part checks linear scale fidelity. Both procedures use the same test method.

A 50 MHz, CW signal is connected to the analyzer RF input. The generator output level is adjusted to place the signal peak at the selected analyzer reference level. The signal amplitude is then reduced using the generator. The scale fidelity figure is determined by calculating the error between the actual displayed and theoretical amplitude levels.

Specification

Log Incremental Accuracy

< ±0.1 dB/dB change over 70 dB range

Log Maximum Cumulative Error

±0.75 dB maximum over −60 dB range from reference level
±1.0 dB maximum over −70 dB range from reference level

Linear Accuracy

< ±3% of reference level setting

Equipment

Synthesizer/Level Generator ................................................. HP 3335A
BNC Cable 120 cm (48 in) ..................................................... HP 10503A

Additional Equipment for Option 001

BNC Cable, 94 cm (37 in), 75Ω ................................. HP part number 15525-80010

Test Procedure: Log Scale Fidelity

1. Set the synthesizer/level generator to output a 50 MHz, 0 dBm, CW signal. Set the output switch to 50Ω.

   (Option 001: Set the switch to 75Ω.)

2. Connect the equipment as shown in Figure 3-13.

   (Option 001: Use the 75Ω cables as specified.)
3. Press the following analyzer keys:

- **PRESET**
- **PEAK SEARCH**
- **SIGNAL TRACK**
- **SPAN** 100 kHz
- **Sweep BW** RES BW 10 kHz
- **VID BW** 300 Hz

*(Option 001: **DISPLAY** DISPLAY UNITS dBm)*

4. Press the following analyzer keys:

- **PEAK SEARCH** **MARKER DELTA**
- **SIGNAL TRACK**

**Note**

The marker delta should read 0.0 ±0.02 dB. If it doesn’t, decrease level generator power and repeat step 5.

5. Set the generator AMPTD INCR for 10 dBm and press **INCR**. Record the marker delta readout in Table 3-14 and in Table 3-18.

6. Repeat step 5 until -70 dBm is obtained. Log scale fidelity error should not exceed ±0.75 dB over the 0 to 60 dB attenuator range, nor ±1.0 dB over the 0 to 70 attenuator range. Additionally, the difference measured between each 10 dB setting should not exceed ±1.0 dB per 10 dB attenuator step.

---

**Figure 3-13. Scale Fidelity Test Setup**
11. Scale Fidelity Test

Test Procedure: Linear Scale Fidelity

1. As necessary, reset the signal generator to output to 50 MHz, 0 dBm, CW signal. Set generator AMPTD INCR for 6 dBm.

2. Press the following analyzer keys:

   - PRESET
   - FREQUENCY 50 MHz
   - SPAN 10 MHz
   - PEAK SEARCH
   - SIGNAL TRACK
   - SWEEP BW
   - RES BW 1 MHz
   - AMPLITUDE LINEAR

3. Set the generator output level as needed to place the display trace for the signal peak at the top graticule line. Note the marker amplitude reading on the display at the reference level. A theoretical level of 0 dBm should correspond to a displayed level of 223.6 mV.

   *(Option 001: 0 dB should correspond to displayed level of 273.9 mV.)*

---

**Note**

When changing generator settings in the following steps, allow the analyzer to sweep the signal several times before recording the marker amplitude. This delay allows the video bandwidth filter in the analyzer to charge fully and thus improve overall test accuracy.

---

4. Press the generator [INCR]. The displayed signal peak trace should be at the fourth graticule division above the baseline. The marker amplitude should read half as much as in step 4, ±3% of the reference level amplitude (that is, 111.8 mV ±6.71 mV). Record the test result in Table 3-15 and Table 3-18.

   *(Option 001: 136.95 mV ±8.22 mV)*

5. Set the step attenuator for 12 dB of attenuation. The displayed signal peak trace should be at the sixth graticule division above the baseline. The marker amplitude should read half as much as in step 5, ±3% of the reference level amplitude (that is, 55.9 mV ±6.71 mV). Record the test result in Table 3-15 and Table 3-18.

   *(Option 001: 68.48 mV ±8.22 mV)*

12. Frequency Drift Test

A 300 MHz, CW signal is applied to the analyzer RF input. After centering the signal on the analyzer display (CRT) for 5 minutes, the marker delta function of the analyzer is used to determine frequency drift over a 5 minute period. The spectrum analyzer must be warmed up for a minimum of 2 hours prior to running this test.

Specification

Frequency drift:

<50 kHz/5 minutes after 2 hour warm-up and 5 minutes after setting center frequency.

Equipment

Signal Generator ........................................... HP 8340A  
BNC Cable 120 cm (48 in) ...................................... HP 10503A  
Adapter, Type SMA (m) to BNC (f) .................. HP part number 1250-1200  
Adapter, Type SMA (f) to SMA (f) .................. HP part number 1250-1158

Additional Equipment for Option 001

Minimum Loss Adapter ........................................... HP 11852B  
Adapter, Type N (m) to BNC (f) .................. HP part number 1250-0780  
Adapter, 75Ω Type N (m) to 75Ω BNC (m) ........ HP part number 1250-1534  
BNC Cable, 94 cm (37 in), 75Ω ........ HP part number 15525-80010

Test Procedure

Note Be sure the unit is warmed up as described in specifications before performing the frequency drift test. This is needed to ensure an accurate evaluation of instrument operation and calibration.

1. Set the sweep to output a 300 MHz, −10 dBm, CW signal.

2. Connect equipment as shown in Figure 3-14.

   (Option 001: Connect the signal generator to the HP 8590A with the minimum loss adapter.)

3. Press the following analyzer keys:

   [PRES] (wait until preset is complete)  
   [FREQUENCY] 300 [MHz]  
   [PEAK SEARCH]  
   [SIGNAL TRACK]  
   [SPAN] 100 [kHz]

3-52 Performance Tests
4. Wait 5 minutes, then press the following analyzer keys:

```
MARKER MARKERS OFF [TRACE A] MAX HOLD A
```

Wait 5 minutes, accurately timing the period using a timepiece.

Press [MKR] MARKER NORMAL. Using the knob, place the marker on the peak of the lowest frequency.

Press MARKER DELTA. Using the knob, place the delta marker on the peak of the highest frequency.

Read the marker delta frequency. Drift should not exceed 50 kHz plus a span accuracy of 0.3 kHz per graticule division. Record the frequency drift below and in Table 3-18.

**Note**

Drift contributed by the signal generator is negligible, provided the critical specifications in test equipment (Table 3-3) are satisfied.

```
Frequency Drift <50 kHz (+0.3 kHz/div)
```

**Figure 3-14. Frequency Drift Test Setup**
13. Resolution Bandwidth Switching Test

In this test, the analyzer calibration (CAL Output) signal is applied to the RF input. The deviation in displayed peak signal amplitude for each IF resolution bandwidth filter is measured using the peak search function.

Specification

Resolution Bandwidth Switching (Amplitude Variation)

< ±0.25 dB for 3 kHz to 3 MHz range

Equipment

BNC Cable, 23 cm (9 in) ............................................. HP 10502A

Equipment for Option 001

BNC Cable, 30 cm (12 in), 75Ω ......................... HP part number 5062-6452

Test Procedure

1. Connect the BNC cable from the CAL output to the RF input of the analyzer.

2. Press the following analyzer keys:

   PRESET (wait until preset is complete)
   PEAK SEARCH (be sure you are on the Cal signal or use NEXT PEAK RIGHT)
   SIGNAL TRACK
   SPAN 50 (kHz)
   SWEEP BW RES BW 3 (kHz)
   VID BW 1 (kHz)
   (Option 001: DISPLAY DISPLAY UNITS dBm)
   AMPLITUDE 20 (dBm)
   LOG dB/DIV 1 dB

3. Press AMPLITUDE and use the knob to place the signal peak one division below the reference level. Press PEAK SEARCH MARKER DELTA SIGNAL TRACK.

4. Set the RES BW and SPAN according to Table 3-16.

   The amplitude reading should be within the limits in Table 3-16.

5. Repeat step 4 for each of the remaining resolution bandwidths and spans indicated in Table 3-16.

14. Gain Compression Test

A signal generator and a synthesizer are used to input two signals to the analyzer input mixer via a directional bridge. The synthesizer is set to output an 80 MHz, −24 dBm, CW signal through the directional bridge, which has a 6 dB loss. This signal must be at least 20 dB below the analyzer’s compression-level threshold, which is −10 dBm. The signal generator is set to output a 100 MHz, 0 dBm, CW signal at the directional bridge’s load connector.

First, the signal generator and synthesizer output levels are calibrated using a power meter. The synthesizer output is then connected to the bridge and measured by the analyzer to establish a reference level for the test. Next, the signal generator is connected, and the synthesizer is disconnected, for the compression-level evaluation. The analyzer’s marker delta function is used to determine the resulting compression level.

Specification

Gain Compression

RF Input <1 dB for −10 dBm total power at input mixer
Internal IF <1 dB when signals are higher than reference level and total power at input mixer is −20 dBm.

Equipment

Level Generator ......................................................... HP 3335A
Synthesized Sweeper ................................................. HP 8340A/B
Directional Bridge .................................................. HP 8721A
Power Meter ......................................................... HP 436A
Power Sensor ......................................................... HP 8482A
BNC Cable, 120 cm (48 in) (2 required) ......................... HP 10503A
Adapter, Type N (f) to BNC (m) ................................. HP part number 1250-0077
Adapter, BNC (m) to BNC (m) .................................. HP part number 1250-0216
Adapter, Type SMA (m) to BNC (f) ......................... HP part number 1250-1200
Adapter, Type SMA (f) to SMA (f) ......................... HP part number 1250-1158

Additional Equipment for Option 001

Power Sensor, 75Ω ......................................................... HP 8483A
Adapter, Type N (f) to BNC (m), 75Ω ........................ HP part number 1250-1534
Adapter, BNC (m) to BNC (m), 75Ω ......................... HP part number 1250-1288

Test Procedure

1. Zero and calibrate the HP 436A and HP 8482A combination in log mode (power reads out in dBm). Enter the power sensor’s 50 MHz Cal Factor into the HP 8902A.

   *(Option 001: Calibrate the HP 8483A 75Ω power sensor.)*
2. Set the signal generator to output a 100 MHz, CW signal. Connect the level generator to the REFLECTED power connector of the directional bridge, as shown in Figure 3-15. Use the power meter and power sensor to set the signal generator output level to 0 dBm, measured at the LOAD connector of the directional bridge. Temporarily disconnect the signal generator from the directional bridge. Terminate the REFLECTED port with a 50Ω load.

3. Set the synthesizer to output an 80 MHz, CW signal. Connect the BNC cable to the synthesizer RF output. Use a power meter and power sensor to set the synthesizer output level to –24 dBm at the free end of the BNC cable. Connect the synthesizer to the SOURCE connector of the directional bridge, as shown in Figure 3-15.

4. Connect the LOAD connector of the directional bridge with the adapter, to the HP 8590A RF input, as shown in Figure 3-15.

   (Option 001: Use the HP 8483A power sensor with a Type N (f) to BNC (m) 75Ω adapter (HP part number 1250-1534) and use a BNC (m) to BNC (m) 75Ω adapter (HP part number 1250-1288) in place of the 50Ω adapter.)

5. Press the following analyzer keys:
   - PRESET (wait until preset is complete)
   - FREQUENCY 80 MHz
   - SPAN 10 MHz
   - PEAK SEARCH
   - SIGNAL TRACK
   - SWEEP BW RES BW 3 MHz
   - VID BW 300 Hz
   - (Option 001: DISPLAY DISPLAY UNITS dBm)
   - AMPLITUDE LOG dB/DIV 5 dB
   - MKR MARKER DELTA

6. Reconnect the level generator to the REFLECTED connector of the directional bridge. Note the marker delta readout on the analyzer display. The marker delta amplitude change should not exceed 1 dB.
14. Gain Compression Test

Figure 3-15. Gain Compression Test Setup
15. Input Attenuator Accuracy Test

The input attenuator's switching accuracy is tested over the full 0 dB to 70 dB range. Switching accuracy is referenced to the 10 dB attenuator setting. The attenuator in the synthesizer/level generator is the measurement standard.

Specification

<±0.5 dB over 0 to 60 dB range
<±0.75 dB over 0 to 70 dB range

Equipment

Synthesizer/Level Generator ................................................. HP 3335A
Step Attenuator, 1 dB steps .................................................. HP 355C
Step Attenuator, 10 dB steps ................................................ HP 355D

Cable Assembly

BNC Cable (120 cm, 48 in) ..................................................... HP 10503A
BNC Cable (120 cm, 48 in) .................................................. HP 10502A

Adapters

Type BNC (m) to BNC (m) ..................................................... HP part number 1250-0216

Test Procedure

1. Connect the equipment as shown in Figure 3-16. Set the HP 355D to 20 dB attenuation and the HP 355C to 0 dB attenuation.

2. Set the HP 3335A controls as follows:

   FREQUENCY 50 MHz
   AMPLITUDE -50 dBm
   AMPTD INCR 10 dB
   OUTPUT 50 ohms

3. On the HP 8590A, press PRESET and wait for the preset to finish. Set the controls as follows:

   CENTER FREQUENCY 50 MHz
   SPAN 10 MHz
   REF LEVEL -70 dBm
   LOG dB/DIV 1 dB
   RES BW 10 kHz

4. On the HP 8590A, press:

   PEAK SEARCH
   SIGNAL TRACK (ON)
   SPAN 100 kHz

   Set the VID BW to 100 Hz.
15. Input Attenuator Accuracy Test

5. Set the HP 355C attenuation to place the signal peak 2 to 3 dB (two to three divisions) below the reference level.

6. On the HP 8590A, press:

   ![TRIG]
   SINGLE SWEEP
   PEAK SEARCH
   MARKER DELTA
   SIGNAL TRACK

7. Set the HP 3335A AMPLITUDE to -60 dBm as indicated in row 2 of Table 3-17.

8. Set the HP 8590A, REF LEVEL to -80 dBm and ATTEN to 0 dB as indicated in row 2 of Table 3-17.

9. On the HP 8590A, press TRIG and SINGLE SWEEP, and wait for a new sweep to finish. Press PEAK SEARCH and record the marker delta amplitude in Table 3-17 as the Actual reading. The marker delta amplitude reading should be within the limits shown.

10. Repeat steps 7 through 10 using the HP 3335A AMPLITUDE and HP 8590A REF LEVEL and ATTEN settings listed in Table 3-17.

Performance Tests 3-65
If Something Goes Wrong...

What You'll Find in This Chapter

Your HP 8590A Spectrum Analyzer is built to provide dependable service. It is unlikely that you will experience a problem with the HP 8590A. However, if you do, or if you desire additional information or wish to order parts, options, or accessories, Hewlett-Packard's worldwide sales and service organization is ready to provide the support you need.

In general, a problem can be caused by a hardware failure, a software error, or a user error. Follow these general steps to determine the cause and to resolve the problem:

- Perform the quick checks listed in the "Check the Basics" section; these checks may eliminate the problem altogether, or may give a clearer idea of its cause.

- If the problem is a hardware problem, you have several options:
  - Repair it yourself; see the "Service Options" section.
  - Return the analyzer to Hewlett-Packard for repair;
    - If the analyzer is still under warranty or is covered by a Hewlett-Packard maintenance contract, it will be repaired under the terms of the warranty or maintenance contract (the warranty is printed on the inside front cover of this manual).
    - If the analyzer is no longer under warranty or covered by a Hewlett-Packard maintenance contract, Hewlett-Packard will notify you of the cost of the repair after examining the unit.

See the "How to Call Hewlett-Packard" and "How to Return Your Analyzer for Service" sections for more information.
Before You Call Hewlett-Packard

Check the Basics

A problem often can be solved by rechecking what was being done when the problem occurred. A few minutes spent in performing some simple checks may save waiting for your instrument to be repaired. Before calling Hewlett-Packard or returning the analyzer for service, please make the following checks:

- Is the analyzer plugged in to the proper ac power source? Does the line socket have power?
- Is the rear-panel voltage selector switch set correctly? Is the line fuse good?
- Is the analyzer turned on?
- If other equipment, cables, and connectors are being used with the HP 8590A, are they connected properly and operating correctly?
- Review the procedure for the test being performed when the problem appeared. Are all the switch settings correct?
- Is the test being performed, and the results that are expected, within the specifications and capabilities of the HP 8590A? (See Chapter 1, “Introducing the HP 8590A,” Table 1-1, for analyzer specifications.)
- Is the HP 8590A displaying an error message? If so, refer to Appendix A, “HP 8590 Messages.”
- Are the analyzer’s measurements obviously inaccurate? If so, the analyzer’s calibration data may have been destroyed. Refer to the HP 8590A Support Manual or contact the nearest Hewlett-Packard Sales and Service Office listed in Table 4-1.
- Perform the frequency and amplitude calibration routines given in the “Turning the HP 8590A On for the First Time” section in Chapter 2, “Preparation for Use.” After running these routines, perform the Confidence Test that is described in the same section. Record all error messages that appear.
- If the necessary test equipment is available, perform the Operation Verification tests given in Chapter 3, “Performance Tests.” Record all results on an Operation Verification Test Record form (Figure 2-1).
Read the Warranty

The warranty for your HP 8590A is printed on the inside front cover of this manual. Please read it and become familiar with its terms.

If your analyzer is covered by a separate maintenance contract, please be familiar with its terms.

Service Options

Hewlett-Packard offers several maintenance services for your analyzer after the warranty has expired. Call your Hewlett-Packard Sales and Service office for full details.

If you want to service the analyzer yourself after the warranty expires, you can purchase a Service Documentation Package that provides all necessary test and maintenance information. You can order the Service Documentation Package, HP part number 08590-90007, through your HP Sales and Service office. The package is described under “Service Documentation (Option 915)” in Chapter 1, “Introducing the HP 8590A,” of this manual.

How to Call Hewlett-Packard

Hewlett-Packard has Sales and Service offices around the world to provide you with complete support for your HP 8590A. To obtain servicing information or to order replacement parts, contact the nearest Hewlett-Packard Sales and Service Office listed in Table 4-1. In any correspondence or telephone conversations, refer to the instrument by its model number and full serial number. With this information, the Hewlett-Packard representative can quickly determine whether your unit is still within its warranty period.

How to Return Your Analyzer for Service

Service Tag
If you are returning the analyzer to Hewlett-Packard for servicing, fill in and attach a blue service tag. Several service tags are supplied at the rear of this manual.

Please be as specific as possible about the nature of the problem. If you have recorded any error messages that appeared on the screen, or have completed a Performance Test Record, or have any other specific data on the performance of the analyzer, please send a copy of this information with the unit.

Original Packaging
Before shipping, pack the unit in the original factory packaging materials if they are available. If the original materials were not retained, identical packaging materials are available through any Hewlett-Packard office. Descriptions of the packaging materials are listed in the legend for Figure 2-1.
Other Packaging

Caution
Analyzer damage can result from using packaging materials other than those specified. Never use styrene pellets in any shape as packaging materials. They do not adequately cushion the equipment or prevent it from shifting in the carton. They cause equipment damage by generating static electricity and by lodging in the analyzer fan.

You can repack the instrument with commercially available materials, as follows:

1. Attach a completed service tag to the instrument.
2. If you have a front-panel cover, install it on the instrument; if not, protect the control panel with cardboard.
3. Wrap the instrument in antistatic plastic to reduce the possibility of damage caused by electrostatic discharge.
4. Use a strong shipping container. A double-walled, corrugated cardboard carton with 159 kg (350 lb) bursting strength is adequate. The carton must be both large enough and strong enough to accommodate the analyzer. Allow at least 3 to 4 inches on all sides of the analyzer for packing material.
5. Surround the equipment with 3 to 4 inches of packing material and prevent the equipment from moving in the carton. If packing foam is not available, the best alternative is S.D.-240 Air Cap™ from Sealed Air Corporation (Commerce, California, 90001). Air Cap looks like a plastic sheet filled with 1-1/4 inch air bubbles. Use the pink-colored Air Cap to reduce static electricity. Wrapping the equipment several times in this material should both protect the equipment and prevent it from moving in the carton.
6. Seal the shipping container securely with strong nylon adhesive tape.
7. Mark the shipping container “FRAGILE, HANDLE WITH CARE” to assure careful handling.
8. Retain copies of all shipping papers.
HP 8590A Messages

The HP 8590A can generate various messages that appear on its screen during operation to provide an indication of progress through a procedure or to indicate a problem.

There are three types of messages: hardware error messages (H), user-created error messages (U), and informational messages (M).

- Hardware error messages indicate the HP 8590A hardware is probably broken.
- User-created error messages appear when the analyzer is used incorrectly. They are usually generated during remote operation.
- Informational messages indicate analyzer progress within a specific procedure.

The messages are listed in alphabetical order on the following pages; each message is defined, and its type is indicated by an (H), (U), or (M). In several instances, you are referred to the command description (for example, “See AUNITS.”) These command descriptions are contained in the HP-IB, HP-IL, and RS-232 Programming Manuals.
ADC-GND FAIL
Indicates a failure in the analog-to-digital converter. (H)

ADC-TIME FAIL
Indicates a failure in the analog-to-digital converter. (H)

ADC-2V FAIL
Indicates a failure in the analog-to-digital converter. (H)

CAL: FM SPAN SENS FAIL
The analyzer could not set up span sensitivity of the FM coil. (H)

CAL: LINEAR DET FAIL
The linear calibration routine failed. (H)

CAL: RES BW AMPL FAIL
The relative insertion loss of the resolution bandwidth is incorrect. (H)

CAL: SPAN SENS FAIL
The calibration span sensitivity routine failed. (H)

CAL: --
During the calibration routine, messages may appear on the display indicating the routine is progressing: MC DELAY, FM DELAY, DONE, SWEEP, SWP DELAY, FREQ, SPAN, AMPD, 3dB BW, ATTN, LOG AMP. (M)

COMMAND ERROR: --
The specified command is not recognized by the analyzer. (U)

CONFLICT TABLE OVERFLOW
A command has been used that is not compatible with the HP 8590A. (U)

FAIL: --
An error was discovered during the power-up check. The 4-digit by 8-digit code indicates the type of error. (H)

INVALID AUNITS: --
The amplitude units are not valid. See AUNITS. (U)

INVALID BLOCK FORMAT: IF STATEMENT
An invalid block format appeared within the IF statement. (U)

INVALID CHECKSUM: USTATE
The user-defined state does not follow the expected format. (U)

INVALID COMPARE OPERATOR
An IF/THEN or DO/UNTIL routine is improperly constructed. (U)

INVALID DETECTOR: --
The specified detector is not valid. See DET. (U)

INVALID ENTER FORMAT
The enter format is not valid. See the appropriate command description to determine the correct format. (U)

INVALID HP-IB ADDRESS OR OPERATION
An HP-IB operation was aborted due to an incorrect address or invalid operation. (U)
INVALID HP-IB OPERATION REN TRUE
The HP-IB operation is not allowed. (Usually caused by print/plot when a calculator is on the interface bus.) (U)

INVALID HP-IL ADDRESS OR OPERATION
An HP-IL operation was aborted due to an incorrect address or invalid operation. (U)

INVALID HP-IL OPERATION REN TRUE
The HP-IL operation is not allowed. (Usually caused by print/plot when a calculator is on the interface bus.) (U)

INVALID KEYNAME: ___
The specified keyname is not allowed. (The keyname may conflict with an analyzer command.) (U)

INVALID OUTPUT FORMAT
The output format is not valid. See the appropriate command description to determine the correct format. (U)

INVALID REPEAT MEM OVFL
Memory overflow occurred due to REPEAT routine. (U)

INVALID REPEAT NEST LEVEL
The nesting level in the REPEAT routine is improperly constructed. (U)

INVALID RS-232 ADDRESS OR OPERATION
An RS-232 operation was aborted due to an incorrect address or invalid operation. (U)

INVALID SAVE REG
Data has not been saved in the specified state register. (U)

INVALID SYMTAB: EEROM OVERFLOW
The operator has cataloged too much data. (U)

INVALID SYMTAB: SYMTAB OVERFLOW
There is a symbol table overflow. (U)

INVALID TRACE: ___
The specified trace is invalid. See trace commands (VIEW, MXMH, CLRW, or BLANK). (U)

INVALID TRACE NAME: ___
The specified trace name is not allowed. (U)

INVALID TRIGGER MODE: ___
The specified trigger mode is invalid. See TM. (U)

INVALID VARDEF: ___
The specified variable name is not allowed. (U)

INVALID WINDOW TYPE: ___
The specified window is invalid. See TWNDOW. (U)

MEAS UNCAL
The measurement is uncalibrated. Check the sweep time, span, and bandwidth settings. (U)

PARAMETER ERROR: ___
The specified parameter is not recognized by the analyzer. See the appropriate command description to determine the correct parameters. (U)
SRQ ___
The specified service request is active. Service requests are a form of informational message and are explained in Appendix B. (M)

SOFTKEY OVFL
Softkey nesting exceeds the maximum number of levels. (U)

UNDEF KEY
A referenced softkey is not recognized by the analyzer. (U)
Service Requests

This appendix describes the analyzer service request (SRQ) capability. A service request is an analyzer output that tells the operator or computer that a specific event has taken place in the analyzer.

When writing programs, service requests can be used to interrupt the computer program sequence, causing the program to branch to a subroutine. For example, by using service requests, the computer can perform other operations while the analyzer is sweeping. When the sweep is completed, the computer can service the analyzer by changing the analyzer state or reading data from the display memory.

**Note**

Service requests do not work with computers that have only an RS-232 interface. HP-IB and HP-IL computers do not all have the same service request capabilities. Refer to the manuals supplied by your computer's manufacturer.

When making a service request, the analyzer places the I/O interface SRQ line true and the analyzer CRT display reads out SRQ with a number. Setting the SRQ line true announces to the computer that the analyzer requires attention. The computer can then command the analyzer to send its “status byte.” The status byte indicates the type of service request.

**Note**

If the CRT display annotation has been blanked, the service request notation will not appear.

**Note**

A serial polling technique must be used by the computer to test for service requests. The analyzer does not respond to parallel polling.
Status Byte Definition

The status byte sent by the analyzer determines the nature of the service request. The meaning of each bit of the status byte is explained in Table B-1.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Message</th>
<th>CRT Display Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 (LSB)</td>
<td>Unused</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>Unit Key</td>
<td>SRQ 102</td>
</tr>
<tr>
<td>2</td>
<td>End of sweep</td>
<td>SRQ 104</td>
</tr>
<tr>
<td>3</td>
<td>Hardware broken</td>
<td>SRQ 110</td>
</tr>
<tr>
<td>4</td>
<td>Command complete</td>
<td>SRQ 120</td>
</tr>
<tr>
<td>5</td>
<td>Illegal analyzer command</td>
<td>SRQ 140</td>
</tr>
<tr>
<td>6</td>
<td>Universal HP-IB service request.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>HP-IB RQS bit</td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>Unused</td>
<td></td>
</tr>
</tbody>
</table>

The CRT display message is an octal number based on the binary value of the status byte. This octal number always begins with a "1" since this is translated from bit 6, the universal service request bit. The status byte for an illegal analyzer command (SRQ 140) is as follows:

<table>
<thead>
<tr>
<th>bit number</th>
<th>7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>status byte</td>
<td>0 1 1 0 0 0 0 0</td>
</tr>
</tbody>
</table>

The CRT displays the octal equivalent of the status byte binary number:

SRQ 140

The octal equivalent is based on the whole binary number:

01100000 (binary) = 140 (octal)

One simple way to determine the octal equivalent of the binary number is to partition the binary number three bits at a time from the least significant bit, and treat each part as a single binary number:

<table>
<thead>
<tr>
<th>binary</th>
<th>0 1 1 0 0 0 0 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>octal</td>
<td>1 4 0</td>
</tr>
</tbody>
</table>

B-2 Service Requests
The decimal equivalent of the octal number is determined as follows:

140 (octal) = 1 \times (8) + 4 \times (8) + 0 \times (8) = 96 (decimal)

More than one service request can be sent at the same time. For example, if an illegal analyzer command (SRQ 140) and the end of a sweep (SRQ 104) occurred at the same time, SRQ 144 appears on the CRT display, because both bit 5 and bit 2 are set as shown below:

<table>
<thead>
<tr>
<th>bit number</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>status byte</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>octal value</td>
<td>1</td>
<td>4</td>
<td>4</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Service Request Activating Commands**

With the exceptions of SRQ 140 and SRQ 102, service requests can only be activated from a computer. (SRQ 140 and SRQ 102 are always activated.) Your *HP 8590A Programming Manual* describes service request activating commands in Chapter 4, "If Something Goes Wrong . . . ," under RQS and SRQ.
