Linear Models for Diode Surface Mount Packages

Application Note 1124

Introduction
When linear or non-linear analyses are performed on diode circuits, both the diode chip and its package must be accurately modeled. The diode chip or die itself may be modeled using SPICE parameters, or by a three element linear model as shown in Figure 1.

The three-lead SOT-23 and SOT-323 packages may be modeled as shown in Figure 2. The element values are given in Table 1.

The four-lead SOT-143 package is modeled as shown in Figure 3, with circuit element values given in Table 1.

The six-lead SOT-363 package is described in Figure 4 with element values specified in Table 1.

Note that two package linear equivalent circuits exist for the SOT-3x3 packages. One provides accurate modeling from DC to 3 GHz, while the other can be used at frequencies as high as 6 GHz.
