Keysight N1245B Monolithic Laser Combiner (MLC400B)
Laser-Based Illumination System for Microscopy/Cell Biology

Data Sheet
Overview

Keysight Technologies, Inc. N1245B Monolithic Laser Combiner (MLC400B) is a stable, reliable, and easy-to-use laser-based illumination system that is ideally suited for fluorescence and confocal microscopy research in cellular biology. The N1245B (MLC400B) is permanently aligned before leaving the factory, and never needs realignment, making it a reliable light source at multiple wavelengths, with minimal downtime for maintenance. An acousto-optic tunable filter (AOTF) provides fast switching between different combinations of wavelengths and powers. Additional laser lines can be added to the N1245B (MLC400B), as research needs change.

Stable, reliable and easy-to-use

Keysight's proprietary complex monolithic optic (CMO) technology bundles multiple beam-combining optics into a single, permanently aligned optical structure. The CMO design reduces the number of exposed beam-combination surfaces that are subject to contamination and require subsequent cleaning. The beam is delivered to the microscope by a single-mode, polarization-maintaining fiber-coupled delivery system via a proprietary fixed mounting system that keeps the beam-steering optics permanently aligned.

Environmental changes that commonly occur in laboratories, such as temperature, airflow, and bench top vibration, do not affect the N1245B (MLC400B). The beam-combining and beam-steering optics in the N1245B (MLC400B) are fully integrated with the beam delivery architecture to ensure stable, reliable power, day-after-day.

Dual-port output

The N1245B (MLC400B) can be configured with an optional dual-port output for switching between different microscope systems or switching between different illumination paths on the same microscope system. The dual-port option enables experiments such as TIRF/FRAP where continuous switching is required. This dual-port option allows the laser output to be switched from one fiber to another with a rise time of less than 1 ms at a frequency of up to 30 Hz. The switching mechanism in the dual-port option is incorporated into the same alignment-free optical assembly as in the standard beam combiner.

Super resolution imaging

The N1245B (MLC400B) can also be configured for super resolution imaging applications. A selection of extra-high-power laser wavelengths – 647 nm, 561 nm, and 488 nm – can be selected for the excitation wavelength. A switchable neutral density filter option allows repeatable microwatt to sub-microwatt power output for photoactivation.

Microprocessor controller

The N1245B (MLC400B) incorporates a microcontroller that communicates with the AOTF controller and can be used to drive external devices that include a wide array of imaging hardware. Instructional packets that contain a user defined command sequence can be created in the imaging software and downloaded directly to the microcontroller. The N1245B (MLC400B) can be enabled to respond to incoming trigger signals with a predetermined sequence of laser line outputs and output signals that can be directed to specific hardware devices. In bypassing the host computer, the image acquisition rate can be increased and overall cycle time can be reduced.
Optical systems solutions from Keysight Technologies

Keysight offers optical component and assembly solutions for the discriminating researcher. For decades of experience with hundreds of designs and thousands of shipments, coupled with comprehensive testing and support ensure the utmost in precision and reliability under real-world conditions.
