Keysight’s 16860A Series is the industry’s highest-performance portable logic analyzer – providing you the best insight so you can solve your toughest digital debug challenges.

- High-speed state and timing with deep memory – Capture the most system activity (up to 128 Mb) at the highest resolution to identify the root cause of a problem and symptom widely separated in time
- Signal integrity – Quickly identify problem signals with simultaneous eye diagrams on all channels
- Probing and application support – Customize a system for your specific needs with a comprehensive set of probing options and application-specific software
- Upgradable – Purchase the capability you need now, then upgrade as your needs evolve

Identify Problem Signals on All Channels Simultaneously

As timing and voltage margins continue to shrink, confidence in signal integrity becomes an increasingly vital requirement in the design validation process. Eye scan lets you acquire signal integrity information on all the buses in your design (and under a wide variety of operating conditions) in a matter of minutes. Identify problem signals quickly for further investigation with an oscilloscope. Results can be viewed for each individual signal or as a composite of multiple signals or buses.

Figure 1. Eye scan automatically sets sample positions for accurate state capture and also provides a signal integrity view of each input signal, without the need for an oscilloscope.
Unleash the Power of a Logic Analyzer Plus an Oscilloscope

Seamless oscilloscope integration with View Scope

Easily make time-correlated measurements between Keysight logic analyzers and oscilloscopes. The time-correlated logic analyzer and oscilloscope waveforms are integrated into a single logic analyzer waveform display for easy viewing and analysis. You can also trigger the oscilloscope from the logic analyzer (or vice versa); automatically de-skew the waveforms; and maintain marker tracking between the two instruments. View Scope allows you to perform the following more effectively:

- Validate signal integrity
- Track down problems caused by signal integrity
- Validate correct operation of A/D and D/A converters
- Validate correct logical and timing relationships between the analog and digital portions of a design

Connection

The Keysight logic analyzer and oscilloscope can be physically connected with standard BNC and LAN connections. Two BNC cables are connected for cross triggering, and the LAN connection is used to transfer data between the instruments. The View Scope correlation software is standard in the logic analyzer’s application software. The View Scope software includes:

- Ability to import some or all of the captured oscilloscope waveforms
- Auto scaling of the scope waveforms for the best fit in the logic analyzer display

<table>
<thead>
<tr>
<th>Feature</th>
<th>Benefit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automated setup</td>
<td>Quickly get to your first measurement by using the logic analyzer’s Help wizard for easy setup, regardless of which supported Keysight oscilloscope you connect to.</td>
</tr>
<tr>
<td>Integrated waveform display</td>
<td>Instantly validate the logical and timing relationships between the analog and digital portions of your design. View oscilloscope and logic analyzer waveforms integrated into a single logic analyzer waveform display.</td>
</tr>
<tr>
<td>Automatic measurement de-skew</td>
<td>Save time and gain confidence in measurement results with measurements that are automatically de-skewed in time.</td>
</tr>
<tr>
<td>Cross trigger the logic analyzer and oscilloscope</td>
<td>Start your debug approach from either the analog or digital domain with the flexibility to trigger the oscilloscope from the logic analyzer (or vice versa).</td>
</tr>
<tr>
<td>Tracking markers</td>
<td>Precisely relate information on the oscilloscope’s display to the corresponding point in time on the logic analyzer display with tracking markers. The oscilloscope’s time markers automatically track adjustments of the logic analyzer’s global markers.</td>
</tr>
</tbody>
</table>
Debug, Verify, and Optimize DDR, LPDDR, and ONFi Memory Systems

The 16860A Series logic analyzers, in conjunction with memory specific probing solutions and B4661A Memory Analysis Software, provide a cost-effective platform for debugging, verifying and optimizing memory designs operating at ≤ 1400 MT/s. You can get a comprehensive view into your system’s memory operation with bus decode, transaction overview, compliance testing and performance analysis.

The 16860A Series supports Add/Cmd/Data state mode measurements for the following DDR and LPDDR memory families. For higher speed or channel count DDR/2/3, LPDDR/2/3, DDR4 and LPDDR4 memory applications, refer to Keysight’s U4164A logic analyzer module which is designed specifically for high-speed memory applications.

</tbody>
</table>

In addition, the 2.5 GHz timing mode provides a 3:1 ratio of sample rate to data rate so you can perform timing measurements on DDR/LPDDR devices with < 400 MHz clock rate/ < 800 Mb/s data rate. When a 16862A or 16864A logic analyzer is configured with the 10 GHz quarter channel timing option, the analyzer is capable of capturing Open NAND Flash Interface (ONFi) traffic. Analysis of captured ONFi traffic is provided through the Performance Analysis option (4FP/4NP/4TP) of the B4661A Memory Analysis Software.
Get Instant Insight into your Design with Multiple Views and Analysis Tools

When you want to understand what your target is doing and why, you need acquisition and analysis tools that rapidly consolidate data and provide insight into your system’s behavior.

Clock channels can be used as data channels.

The state sampling clock mode specifies how the clock inputs are used for sampling. The availability of these state sampling clock modes depends on the state sampling option that you select.

- **Master** - All pods sampled by the master clock definition.
  - In single clock mode, only the clock signal on Pod 1 can be used.
  - In multiple clocks, either a single clock signal can be used or a combination of clocks can be used.
- **Dual sample** - In the dual sample clock mode, you can capture two samples per clock edge with two different threshold offsets and separate sampling positions. These separate threshold offsets and sampling positions allow you to set independent thresholds and sampling positions for Read and Write in DDR/LPDDR captures and for Rising and Falling edge in general-purpose data captures.
- **Master/slave** - Master pod is sampled on master clock and slave pod is sampled on slave clock, but the captured data of both slave and master clocks is saved together when the master clock occurs.
- **Demux** - Data being probed by one pod is demultiplexed into the logic analyzer memory that is normally used for two pods. The demultiplex mode uses the master and slave clocks to demultiplex the data.

**Programmability**

You can write programs to control the logic analyzer application from remote computers on the local area network using COM. The COM automation server is part of the logic analyzer application. This software allows you to write programs to control the logic analyzer. All measurement functionality is controllable via the COM interface.

The remote programming interface works through the COM automation objects, methods and properties provided for controlling the logic analyzer application.

**Extra notes regarding 16860A Series:**
1. Pollution degree 2
2. Installation category II
3. These instruments are intended for use in an indoor lab environment
Ordering Information

A complete logic analysis system includes the logic analyzer, probes, optional application software and accessories. Use the information on the following pages to configure a portable logic analysis system.

16860A Series portable logic analyzer

The base configuration of each 16860A Series logic analyzer includes 350 MHz state, 2.5 GHz timing (full channel) and 2 Mb memory depth standard.

Configuring a logic analyzer to meet your application needs and budget is as easy as 1, 2, 3.

1. Select a channel count to determine the model number. Once the model number is determined, use the entries in that column for the remaining configuration selections.
2. Select the desired state and timing speeds. Note: 10 GHz quarter channel timing mode is available on the 16862A and 16864A models only.
3. Select the memory depth. Memory depth is defaulted to 2 Mb if no selection is made.

- USB mouse
- Accessory bag
- Power cord
# 16860A Series Probing Options

Logic analyzer probes are required and ordered separately. Please specify probes when ordering to ensure the correct connection between the logic analyzer and the device under test.

Consider the following when determining how you’ll connect to the DUT. For more detailed information on probing options, please refer to the Probing Solutions for Logic Analyzers data sheet (pub number: 5968-4632E).

<table>
<thead>
<tr>
<th>Probing Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Flying lead probes</strong></td>
<td>Measure individual signals physically far apart or located where a probe connector hasn’t been designed in. A wide variety of accessories provide the flexibility to connect to IC pins, traces, pads, vias and any signal that resides on the surface of the board.</td>
</tr>
<tr>
<td><strong>Soft Touch connectorless probes</strong></td>
<td>Soft Touch connectorless probes ensure signal quality with ≤ 0.7 pF of capacitive loading. They are compatible with all surface finishes, including lead-free. The probe requires a soft touch footprint designed into your target system.</td>
</tr>
<tr>
<td><strong>Connector probes – Samtec</strong></td>
<td>This high-performance connector solution supports data rates up to 1.5 Gb/s. The probe requires a 100-pin Samtec connector designed into your target system.</td>
</tr>
<tr>
<td><strong>Connector probes – Mictor</strong></td>
<td>This reliable and cost-effective connector solution supports data rates up to 600 Mb/s. Mictor probes require a 38-pin Mictor connector designed into your target system.</td>
</tr>
<tr>
<td><strong>DDR/LPDDR BGA probes</strong></td>
<td>BGA probes work in existing designs and eliminate the need for up front planning or re-design. BGA probes allow you to get signal access to the DDR/LPDDR signals, connecting directly to the balls of the DRAM, enabling you to operate at full speed and acquire high-speed signals without impacting the performance of your design.</td>
</tr>
<tr>
<td><strong>ZIF probes</strong></td>
<td>ZIF probes provide convenient and reliable connection between the BGA probe wings and the U4201A cable that connects to the logic analyzer.</td>
</tr>
</tbody>
</table>
16860A Series Probing Options (Continued)

Direct connect and 90-pin probing options

There are two styles of general purpose probes compatible with 16860A Series logic analyzers: direct connect probes and 90-pin probes. Direct connect probes connect directly to the DUT and the 160-pin connector of the logic analyzer.

![Direct connect flying lead probe connected to a logic analyzer.](image)

90-pin probes require a U4201A logic analyzer cable between the 90-pin probe connector and the connector of the logic analyzer.

![U4201A logic analyzer cable.](image)

### 16860A Series Probing Options (Continued)

**DDR/LPDDR interposers and probes**

The following provides a high-level overview of memory probing components and 16860A Series logic analyzer compatibility. To ensure you order the correct quantity and combination of components for your specific DDR/LPDDR implementation, refer to the data sheet for a specific component for more detailed information. The following include 16860A Series configuration files for easy setup. Refer to page 5 for logic analyzer state speed option requirements.

#### DRAMs, DIMMs and SO-DIMMs operating at ≤ 1400 MT/s

<table>
<thead>
<tr>
<th>Form factor</th>
<th>Signal access</th>
<th>Requires component, qty</th>
<th>16860A Series compatibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>x4/x8, 78-ball</td>
<td>Command, Address, Control and Data</td>
<td>– W3633A BGA interposer, 1&lt;br&gt;– E5847A ZIF probe, 1&lt;br&gt;– U4201A cable, 2</td>
<td>√</td>
</tr>
<tr>
<td>x16, 96-ball, stacked die under 2G</td>
<td>Command, Address, Control and Data</td>
<td>– W3631A BGA interposer, 1&lt;br&gt;– E5845A ZIF probe, 1&lt;br&gt;– U4201A cable, 2</td>
<td>√</td>
</tr>
<tr>
<td>x16, 96-ball, non-stacked die, all depths</td>
<td>Command, Address, Control and Data</td>
<td>– W3636A BGA interposer, 1&lt;br&gt;– E5845A ZIF probe, 1&lt;br&gt;– U4201A cable, 3</td>
<td>√</td>
</tr>
</tbody>
</table>

**DIMM**

| 240-pin DDR3 SDRAM DIMM | Command, Address, Control and Partial Data | – FS2352B DIMM interposer, 1<br>– U4201A cable, 4 | √ | √ | √ |

| 240-pin DDR3 SDRAM DIMM | Command, Address, Control (No data) | – FS2372 DIMM interposer, 1<br>– U4201A cable, 4 | √ | | |

**SO-DIMM**

| 240-pin DDR3 SDRAM SO-DIMM | Command, Address, Control and Partial Data | – FS2354 DIMM interposer, 1<br>Cables connection to logic analyzer included standard with interposer | √ | √ | √ |

| 240-pin DDR3 SDRAM SO-DIMM | Command, Address, Control (No data) | – FS2374 SO-DIMM interposer, 1<br>– U4201A cable, 4 | √ | √ | √ |

1. Refer to the data sheet for a given interposer for information on specific signal access.
2. The required U4201A cables may be more than what a given 16860A Series logic analyzer will support. If the number of U4201A cables is more than what the analyzer supports, some signals will not be available for that model. The maximum number of U4201A cables per analyzer are two for the 16862A, three for the 16863A and four for the 16864A.
Add-in Application Software

If you request the email delivery option, you will be sent an electronic copy of the Entitlement Certificate so you can redeem your license and begin using the software, often on the same day.

Order the appropriate option number for the desired application and license type you order.

- **Fixed perpetual license** - The license is locked to the PC where the software operates.
- **Floating/server perpetual license** - The license is locked to a license server from which the software automatically checks out the necessary licenses. Licenses are checked back into the server once your analysis session is terminated.
- **Transportable perpetual license** - The license is locked to the PC where the software operates, however the license can be moved. The deletion from one host PC is confirmed prior to issuing a license for another host PC.

</table>

### After-purchase upgrades

Buy what you need today and upgrade in the future. The 16860A Series logic analyzer’s state speed, timing speed and memory depth can be independently upgraded. When ordering, if you request the email delivery option, you will be sent an electronic copy of the Entitlement Certificate so you can redeem your license and begin using the upgraded capability, often on the same day.
